

CHAPTER 6

CIRCULATION & STREETScape

The City of San José’s Envision 2040 General Plan supports creating a transportation network of safe, comfortable, convenient, and attractive routes for people who walk, bike, take transit, and drive. This Circulation and Streetscape Chapter develops transportation-focused goals, policies, guidelines and action items to address specific transportation challenges within the Urban Village area. Specifically, this Chapter seeks to achieve the following community-supported goals:

- Improve traffic flow through data collection and application of a multi-modal traffic and transportation system operation, signal coordination and timing improvements. Removing traffic from the road by encouraging off-peak travel and more travel through sustainable modes, including walking, biking, taking transit and ridesharing.
- Limit cut-through traffic, speeding, and parking overflow in residential neighborhoods by slowing speeds and increasing travel-times in residential neighborhoods and providing enough parking to meet the needs of businesses and residents.
- Improve walkability and bikeability with better connections, wider walkways, improved over/under-crossings, bike facilities in residential neighborhoods, protected or buffered green bike lanes on major streets, and better bike parking.
- Remain consistent with the community’s top priorities for future designs of Winchester Boulevard, which are sufficient vehicular travel lanes and protected bike lanes.

IN THIS CHAPTER	
6.1	Transportation Network and Complete Streets for All..... 2
6.2	Existing Transportation Conditions.... 3
6.2-1	Regional Transportation Context..... 3
6.2-2	Existing Physical Conditions..... 4

6.6-1	Multi-Modal Transportation Improvement Plan & Area Development Policy (ADP)52
6.6-2	Phasing.....52

- Complete the fiber optic communication backbone network in order to support robust technology improvements, and appropriately accommodate new technologies, such as autonomous vehicles, in ways that provide net benefit.
- Improve transit options and connections to regional transit facilities by prioritizing transit and by upgrading existing bus stop facilities.
- Improve wayfinding in ways that reinforce and enhance the identity of Village’s neighborhoods.

6.1 Transportation Network and Complete Streets for All

Transportation-based solutions involve decisions in land use planning, choices/changes in behavior, and the physical transportation network. In the past, the traditional approach to encourage alternative forms of travel has been to simply improve infrastructure for bicycles, people who walk, and transit riders.

FIGURE 6-1:
TRANSPORTATION SOLUTION —
THREE-LEGGED STOOL

A well-connected environment and quality sense of place are shaped by a robust transportation network, the adjacent and nearby land uses, and by changes in travel behavior choices.

This Urban Village Plan, however, follows a more comprehensive approach, as represented in Figure 6-1, by considering how changes in land use planning, the transportation network, and travel behavior choices influence the entire travel system. Called the “three-legged stool” concept, this approach is premised in *placemaking*, which has been identified as the overall purpose of the Urban Village planning efforts. The concept focuses on creating a well-connected environment and a quality sense of place that is safe, usable, and accessible for all ages and abilities. The concept is referenced visually in each section to help frame the approaches described. In addition, an alternative transportation hierarchy diagram (Figure 6-2) illustrates the commitment this Urban Village Plan makes to encourage alternative forms of transportation based on typical trip distances for each travel mode. This diagram is also visually reference throughout the document to identify the alternative modes described in each section.

This chapter is broken into the following sections:

- **6.2: Existing Transportation Conditions** reviews the existing regional transportation context and streetscape and circulation conditions within the Urban Village.
- **6.3: Circulation** describes the vehicular, bicycle, pedestrian and transit networks throughout the Urban Village, and identifies goal, policies, and action items for each topic discussed.
- **6.4: Streetscape** describes the broad range of streetscape amenities and facilities that will help achieve the Plan’s goals. This section also

illustrates improvements to specific rights-of-way. Goals, policies, and action items are provided for each topic discussed.

- **6.5: Implementation** discusses related planning and implementation efforts that will aid in the realization of this Plan, including strategies for phasing.

FIGURE 6-2:
ALTERNATIVE TRANSPORTATION HIERARCHY

6.2 Existing Transportation Conditions

This section discusses the existing roadways, transit networks, and bicycle and pedestrian facilities in the Winchester Urban Village. The purpose of this section is to identify the Village's existing assets as well as the infrastructure on which Plan recommendations are based. The section also presents existing plans that help shape the goals and policies of the Urban Village.

6.2-1 REGIONAL TRANSPORTATION CONTEXT

Winchester Boulevard is located in west San José generally parallel to I-880/SR 17, San Tomas Expressway, and Bascom Avenue. The Winchester Urban Village boundary extends from I-280 in the north to midway between Impala Drive and Rosemary Lane in the south. Winchester Boulevard includes a variety of small- to medium- scale retail and commercial uses, with surrounding neighborhoods that are predominately residential. Winchester Boulevard is the primary roadway that provides motorists with access to the residential and commercial establishments within the Urban Village boundary. Other streets, including Moorpark Avenue, Williams Road, and Payne Avenue, also provide some local access to residences and commercial establishments.

Nearby commuter rail, intercity rail, and light rail transit services are all provided at Diridon Station in Downtown San José, located about three miles east of the Urban Village area. Bus service at Diridon Station includes local, express, and shuttle routes. Diridon Station serves Santa Clara Valley Transportation Authority (VTA) bus routes, the Highway 17 Express route, Downtown Area Shuttle (DASH), and the Monterey-San José Express Bus Route. Commuter and intercity rail at Diridon Station is provided by Caltrain, the Altamont Corridor Express (ACE) and Amtrak's Coastal Starlight and Capitol Corridor routes. Light rail transit is provided by VTA on the Mountain View-Winchester line and Santa Clara Caltrain Station.

Future transit services within the Diridon Station area include Bay Area Rapid Transit (BART), which will be extended from Fremont, and the proposed California High Speed Rail linking the northern and southern portions of the state. The Norman Y. Mineta San José International Airport is located approximately 3 miles northeast of the Plan area.

Figure 6-3 shows the existing and planned regional transit networks in the City of San José, and Figure 6-4 shows the proposed transit lines from VTA's Draft Next Network Plan.

6.2-1.1 Regional Streets and Roads (Freeways, Highways, and Expressways)

Regional roadways serving the Winchester Urban Village include Interstate 280 (I-280) and State Route 17 (SR 17)/Interstate 880 (I-880), both of which are operated and maintained by Caltrans. I-280 runs in the north-south direction, generally just to the west of the larger cities of San Francisco Peninsula for most of its route, connecting the cities of San José and San Francisco. SR 17 is a highway that runs in the north-south direction between the cities of San José and Santa Cruz. SR 17 ends at I-280 and becomes I-880 continuing north. I-880 connects the cities of San José and Oakland, running parallel to the southeastern shore of the San Francisco Bay.

6.2-2 EXISTING PHYSICAL CONDITIONS

This section is a discussion of the existing physical conditions of the transportation network as it relates to the Winchester Urban Villages. Appendix A includes a diagram of the existing roadways and streetscape conditions that are relevant to the proposals that follow in sections 6.3 through 6.5.

6.2-2.1 Local Streets and Roadways

Winchester Boulevard is characterized by the City of San José General Plan as a Grand Boulevard and travels north-south from the Town of Los Gatos to the City of Santa Clara. This roadway is the central spine of the Village, and the Village's only vehicular connection across I-280 and to the Santana Row/Valley Fair Urban Village immediately to the north.

Moorpark Avenue, Williams Road, and Payne Avenue are the key local streets that provide east-west connectivity to, through, and from the Urban Village.

6.2-2.2 Walking Conditions

It is feasible to walk to destinations within the Urban Village; however, the existing environment and many of the existing amenities are not designed for people on foot and thereby discourage pedestrian activity. People who walk frequently encounter major barriers, including streets that don't connect, fences, freeways, and sidewalk gaps.

Existing sidewalks do, however, facilitate pedestrian travel throughout the Winchester Urban Village area, connecting people to on-site parking lots, retail and commercial amenities, and nearby residences, and periodic pedestrian crossing locations are available along Winchester Boulevard. Crosswalks are generally located at signalized intersections along Winchester Boulevard, but people who walk are currently prohibited from crossing all four legs at some of these intersections. In addition, Winchester Boulevard features long gaps between crossing locations, and long signal cycles create significant delay for people trying to cross streets.

Sidewalks along Moorpark Avenue, Williams Road, and Payne Avenue accommodate pedestrian travel for people living in the neighborhoods to walk to Winchester Boulevard. In addition, Magliocco Drive, Neal Avenue, Fruitdale Avenue, Van Sansul Avenue, Wallgrove Way, Greentree Way, Fireside Drive, Loma Verde Drive, Driftwood Drive, Williamsburg Drive, David Avenue, Cadillac Drive, and Impala Drive are local streets that provide pedestrian access to Winchester Boulevard.

Several gaps in the sidewalk network exist throughout the planning area; most notably on one side of the street along Winchester Boulevard between Payne Avenue and Fireside Drive, and between Williams Road and Fruitdale Avenue. Sidewalks are also absent on Williams Road between Winchester Boulevard and S Baywood Avenue. Sidewalks along Winchester Boulevard are narrow at specific locations due to roadway amenities, such as street lights, trees and planter boxes, and across I-280.

6.2-2.3 Bicycling Conditions

Bicycle facilities are currently present along Moorpark Avenue, Payne Avenue, and Williams Road in the Winchester Urban Village. These facilities accommodate east-west bicycle travel to and throughout the Urban Village, connecting people to the retail and commercial amenities along Winchester Boulevard and nearby residencies. Moorpark Avenue features a buffered and standard (Class II) bike lane with green paint markings in potential conflict areas on both sides of the roadway. Payne Avenue and Williams Road feature standard bike lanes on both sides of the roadway west of Winchester Boulevard. Discontinuous bicycle networks along Winchester Boulevard presents connectivity challenges along the corridor, and across the I-280 and Winchester Boulevard interchange. Limited bike parking is available in the Winchester Urban Village.

6.2-2.4 Transit

The Santa Clara Valley Transportation Authority (VTA) provides fixed bus routes and light rail services in communities throughout Santa Clara County, including San José.

The Winchester Urban Village is served by public transit with two Santa Clara Valley Transportation Authority (VTA) bus routes along Winchester Boulevard that include Bus Routes 25 and 60. Compared to other VTA bus lines, Route 25 has the third most boardings over its entire route. Together, these two VTA bus routes provide transit connections to Caltrain, VTA Light Rail, Altamont Corridor Express (ACE), Amtrak, and VTA Light Rail in San José. The village is not served by BART, BRT, or light rail. Figure 6-3 shows the existing and planned regional transit connections, and Figure 6-4 maps the proposed transit lines from VTA's Draft Next Network Plan, scheduled to be implemented in the fall of 2017..

FIGURE 6-3: EXISTING AND PLANNED REGIONAL TRANSIT CONNECTIONS

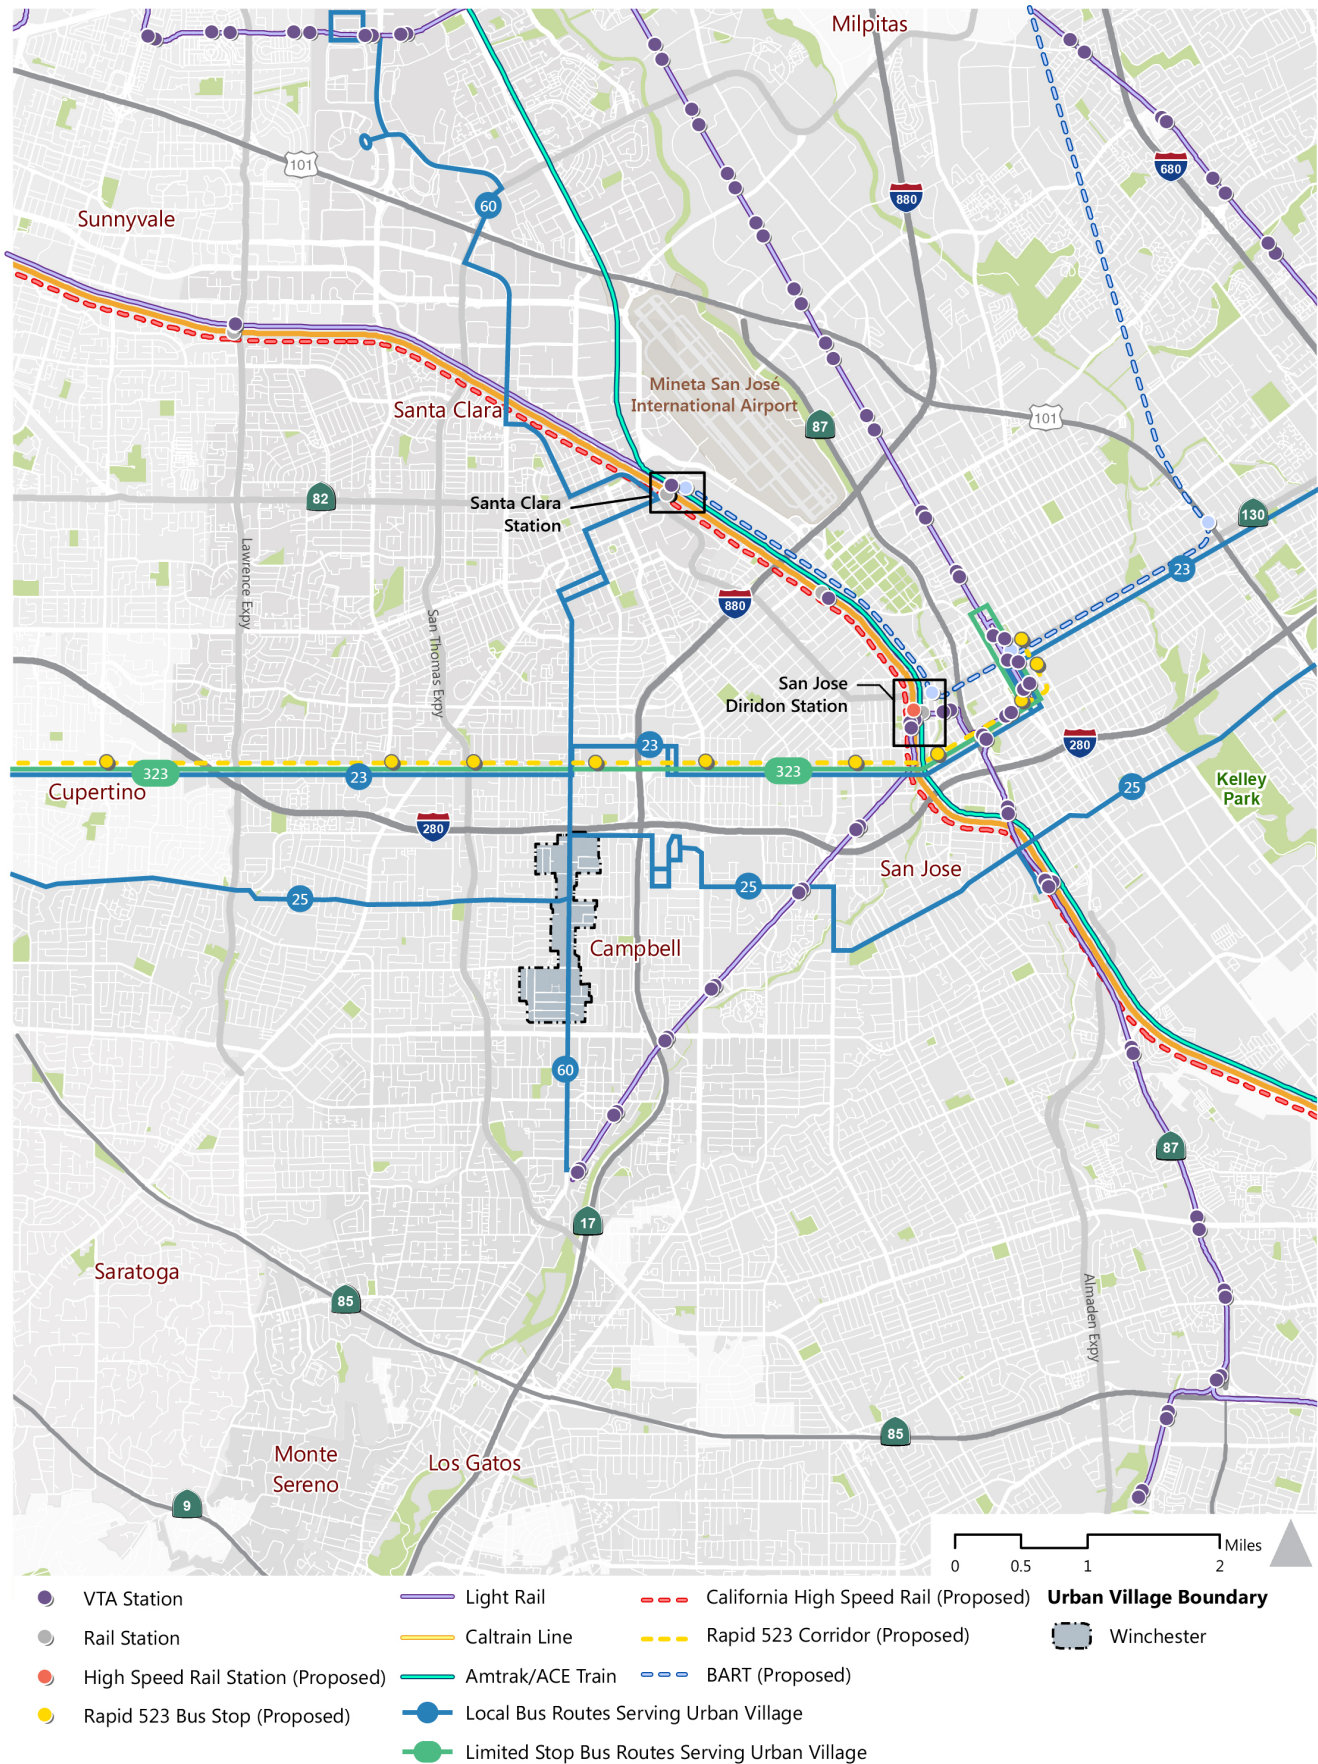

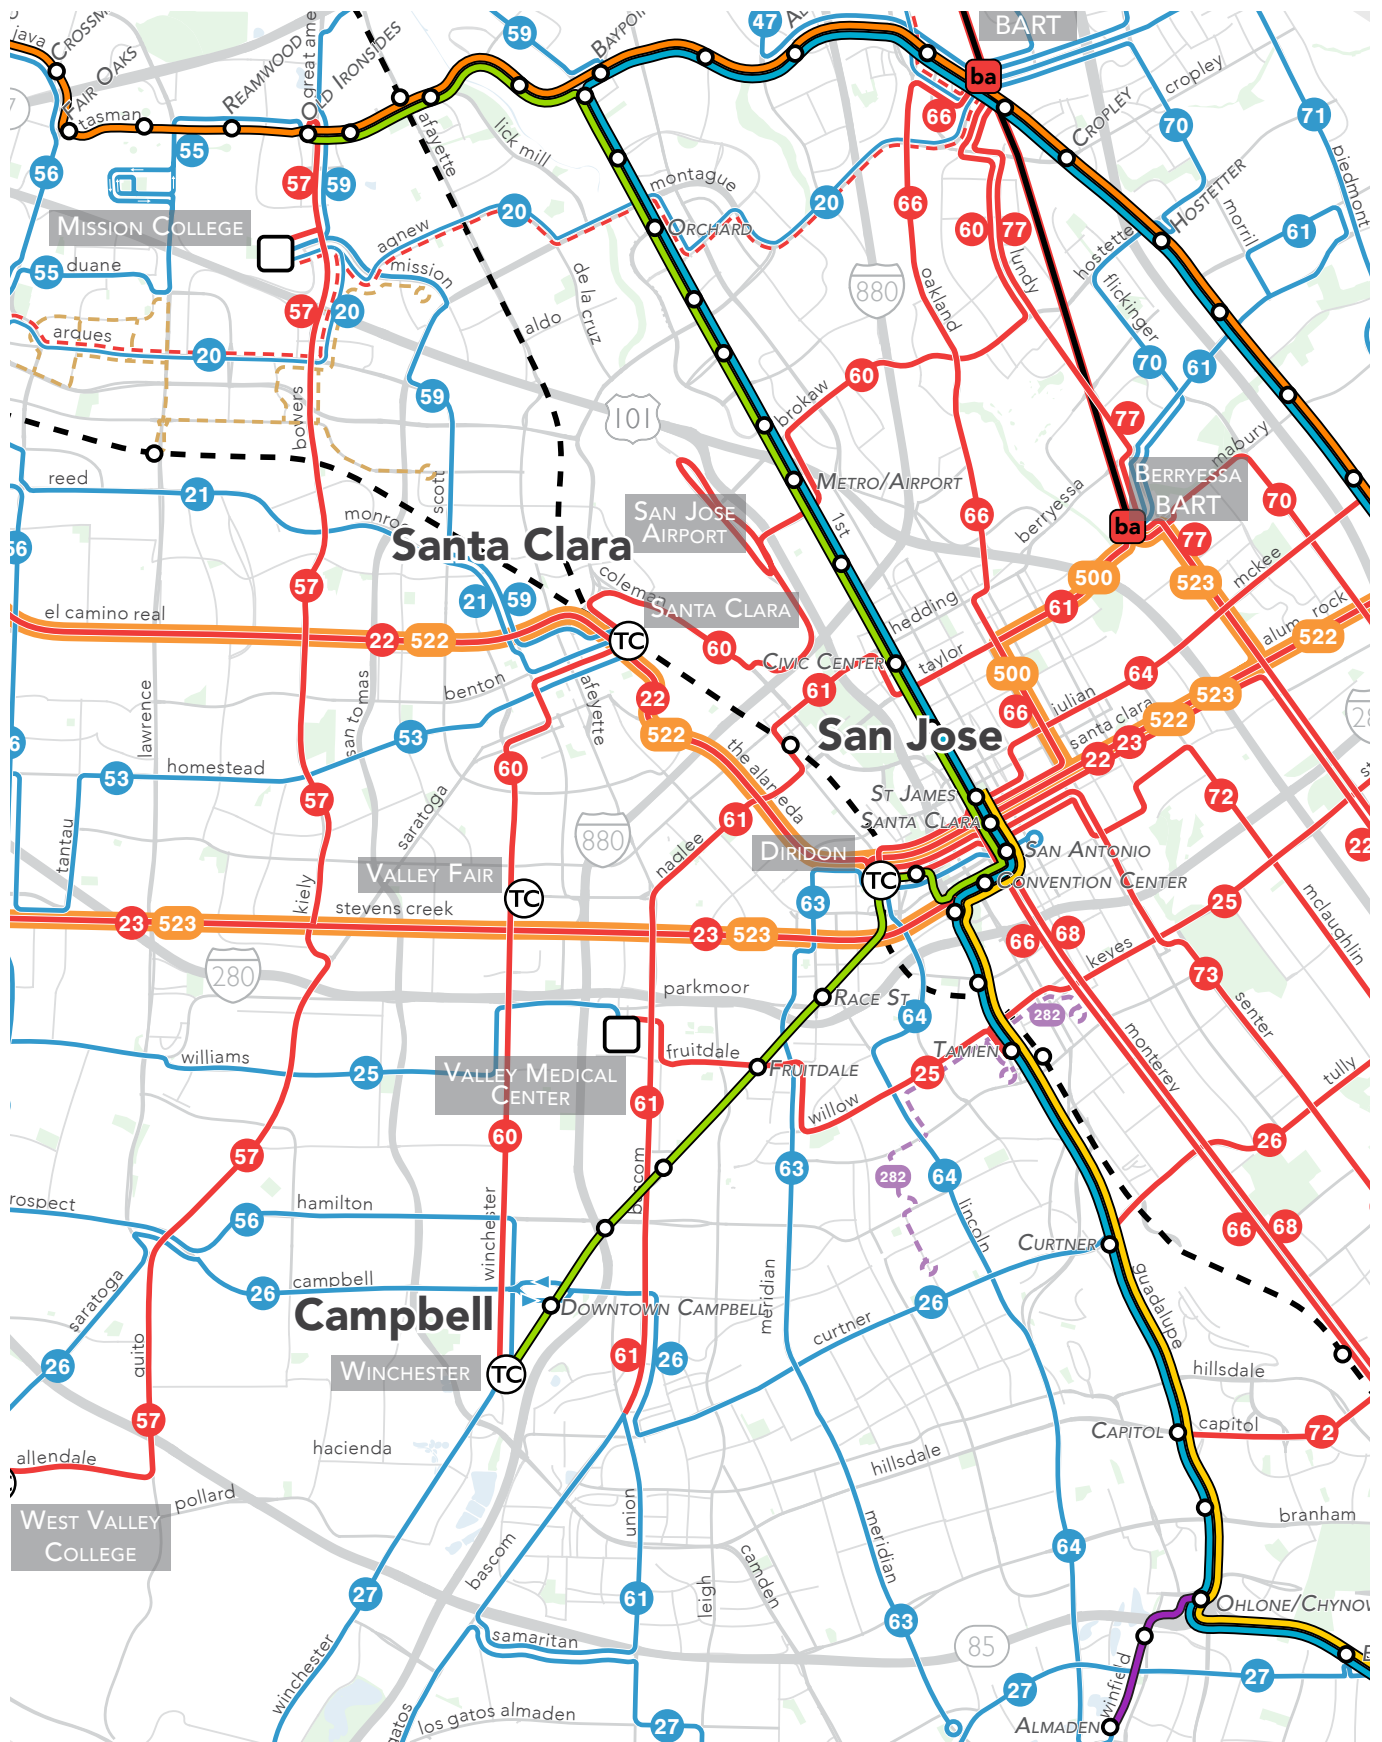

FIGURE 6-4: VTA NEXT NETWORK – REGIONAL TRANSIT CONNECTIONS PLAN
(PROPOSED JANUARY 3, 2017)

6.2-3 RELEVANT PLANS AND POLICIES

Envision 2040 General Plan

San José's Envision 2040 General Plan contains several transportation goals and policies relevant to the Urban Villages. In addition to establishing varying street "typologies" such as Grand Boulevards, Main Streets and others, the General Plan includes policies supporting substantial increases in walking, bicycling, transit trips, and ridesharing. It envisions San José becoming walkable, bikeable, and transit friendly.

San José Complete Streets Design Guidelines (Draft)

San José recently developed Complete Streets Design Guidelines in an effort to provide additional street design guidance and to further articulate the General Plan street typology goals. The Complete Streets Design Guidelines support the creation of streets that are people-oriented, connected and resilient. The Design Guidelines are currently in draft form and are expected to be finalized in early 2017.

Vision Zero San José

Vision Zero San José is the City's commitment to prioritize street safety for all people. It was established in 2015 with the goal of reducing and eventually eliminating all traffic fatalities in the City.

Winchester Strong Neighborhoods Initiative (SNI) Plan

Completed in 2001, the Winchester Strong Neighborhoods Initiative (SNI) Plan seeks to improve traffic flow on Winchester Boulevard, redirect traffic to major thoroughfares, improve pedestrian crossings, improve transit options, complete Winchester streetscape improvements, and address parking congestion.

Winchester Boulevard Enhancement Strategy

Completed in 2010, the Winchester Boulevard Enhancement Strategy focused on improving pedestrian experiences, developing primary bicycle routes on low traffic streets that link to Winchester, and establishing a community shuttle linking regional retail with local institutions like San José City College and the Bascom Branch Library.

6.3 Circulation

This section discusses the range of circulation improvements that seek to complete and enhance the multimodal network, improve traffic flow, and limit cut-through traffic, speeding, and parking overflow. Figure 6-5 shows the general travel time hierarchy for the Urban Village. With the use of technology, traffic management strategies, and improvements to bicycle, pedestrian, and transit networks, traffic delays within the Village can be reduced.

GOAL CS-1 Make improvements to the transportation network that improve traffic flow, enhance multimodal connectivity, and reduce neighborhood cut-through traffic.

Alternative Transportation

6.3-1 VEHICULAR CIRCULATION, TRAFFIC MANAGEMENT AND TECHNOLOGY

This section provides strategies to manage vehicular travel and parking, including Transportation Demand Management (TDM), communication technology improvements, and shared mobility services. Figure 6-6 shows potential vehicle, communication, and technology networks in the Urban Village.

Circulation strategies are shaped by travel behavior choices and the network of transportation options.

6.3-1.1 Corridor Traffic Management

There are several traffic issues along corridors near the Winchester Urban Village ranging from peak hour traffic congestion to high vehicle travel speeds. The biggest issues tend to be located along Winchester Boulevard and at the I-280/Winchester interchange, including at Moorpark Avenue. Regional traffic currently has several potential alternate routes to Winchester Boulevard, including SR 17/SR 880, Bascom Avenue and San Tomas Expressway. These regional roadways experience high levels of congestion during morning and afternoon peak commute hours, as well as on the weekends as travelers make their way to Santana Row and Westfield Valley Fair Mall. Some travelers use alternate routes to avoid congestion in the area, which results in increases in traffic along some neighborhood and residential streets.

GOAL CS-2 Effectively manage traffic to improve traffic flow along regional corridors and major streets.

GOAL CS-3 Use technology to improve transportation system operations.

FIGURE 6-5: WINCHESTER BOULEVARD TRAVEL-TIME HIERARCHY

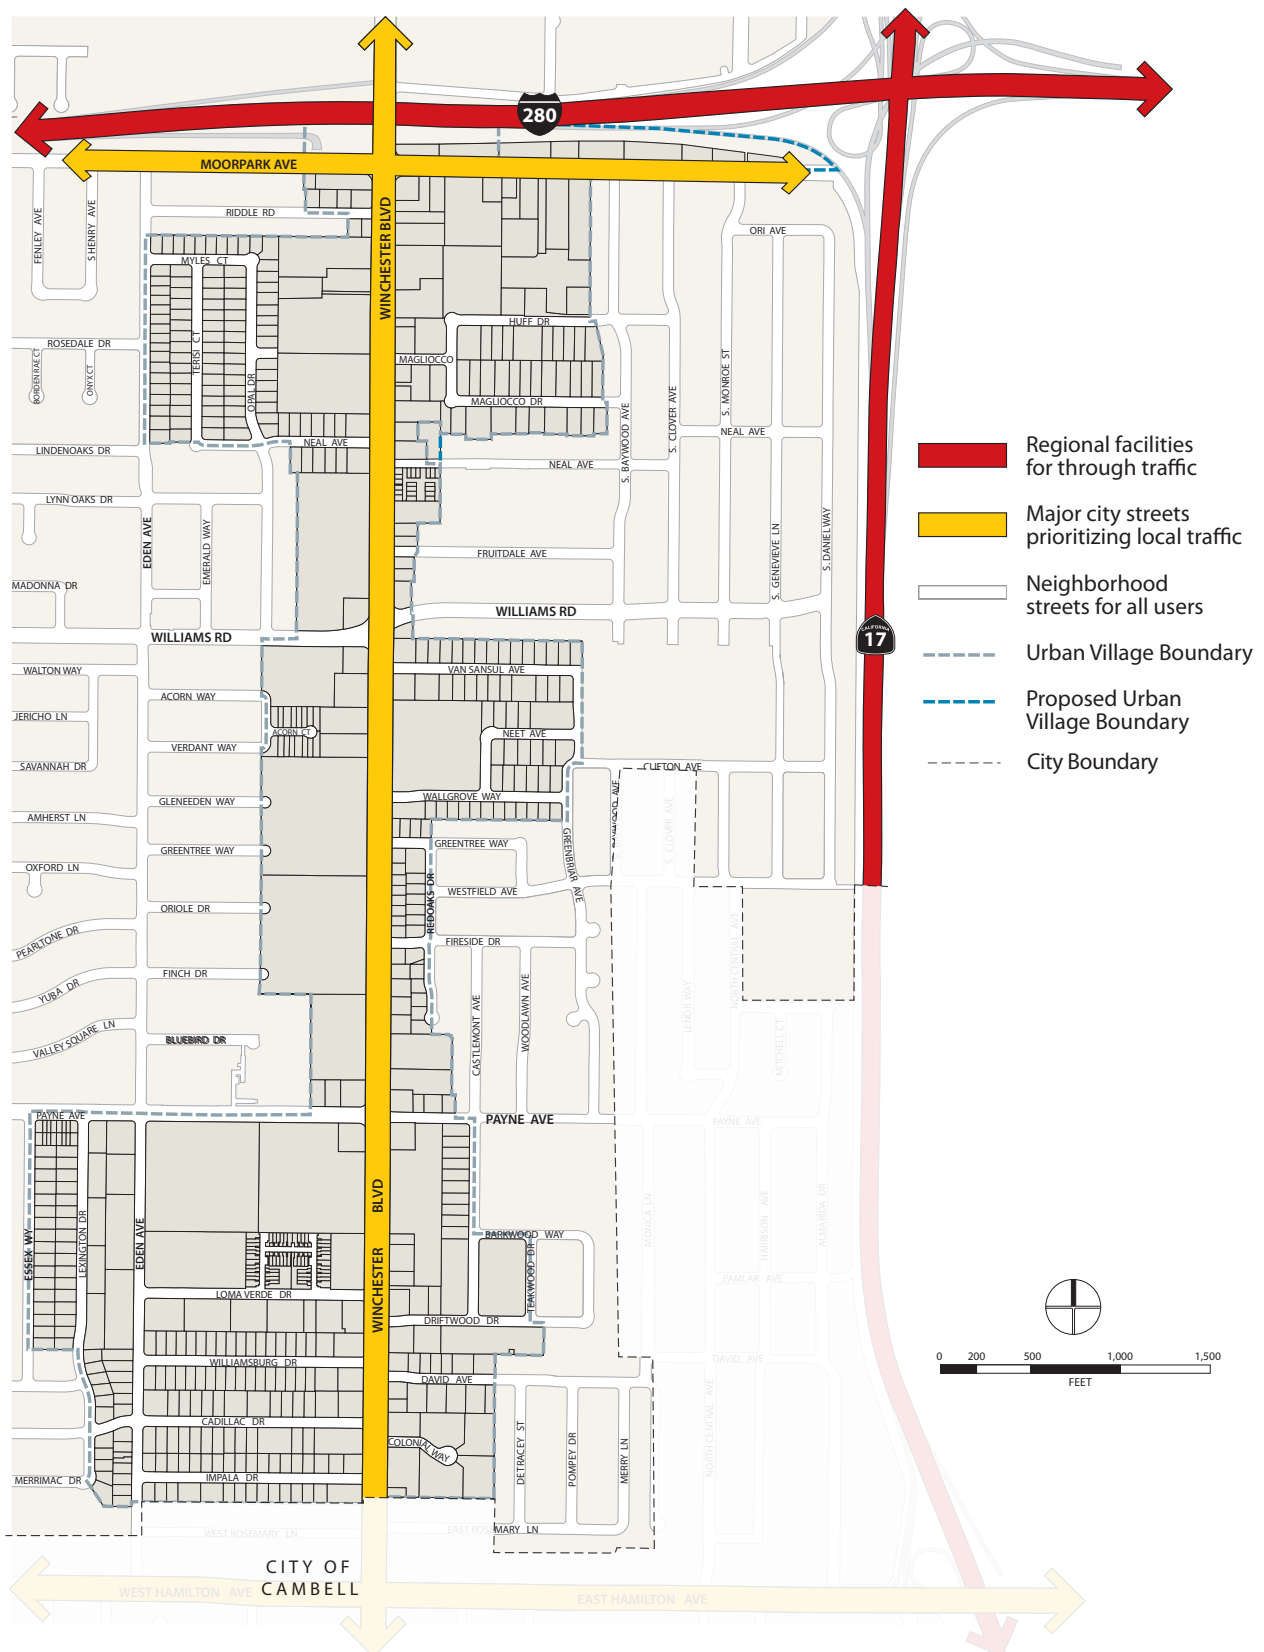

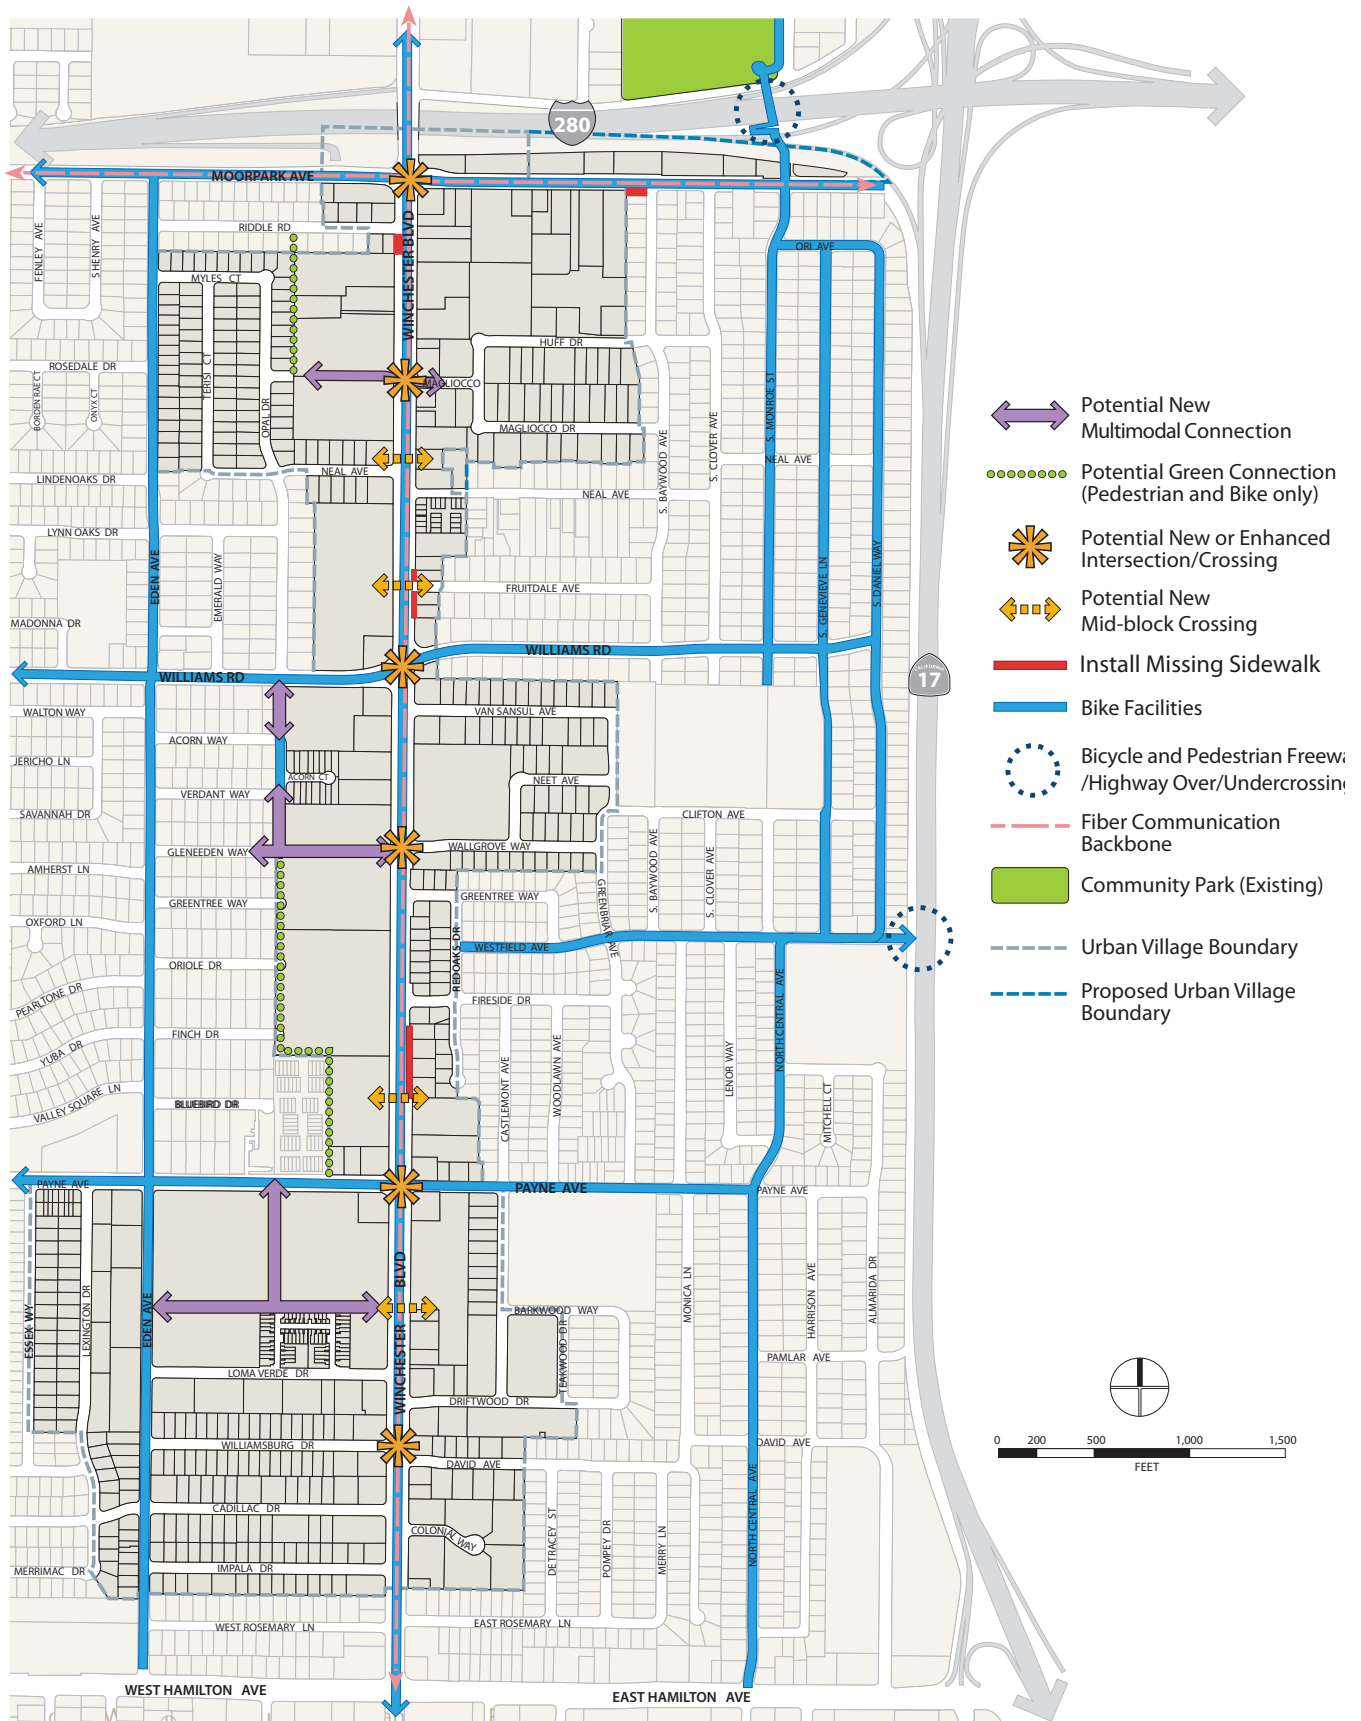

FIGURE 6-6: WINCHESTER BOULEVARD CIRCULATION AND TECHNOLOGY NETWORKS

Policies

- Policy 6-1:** Incorporate corridor-level traffic management strategies that help improve traffic flow and alleviate other traffic issues along major corridors in the Urban Village area.
- Policy 6-2:** Allow designated freight loading zones in front of commercial uses along major corridors during times outside of the peak traffic periods. Loading zones minimize double parking, and time restrictions can help to limit heavy truck travel during the peak periods.
- Policy 6-3:** Complete the fiber-optic cable network that is to be used as the backbone for transportation system communication and operations.
- Policy 6-4:** Implement traffic signal coordination, transit signal priority along transit priority corridors, and real-time adaptation to contribute to safe and efficient traffic flow.
- Policy 6-5:** Incorporate pedestrian and bike sensors into the signal system to support reliable signal priority for active travel modes.
- Policy 6-6:** Upgrade traffic detection systems from traditional in-pavement loops to video detection technologies that more readily support bike detection and are more immune to poor pavement conditions.
- Policy 6-7:** Maintain the existing roadway network to support automobile and transit operations.

Traffic calming devices reduce vehicular travel speeds and improve safety for all users of the road.

Action Items

- » Implement corridor level traffic management strategies along Winchester Boulevard and Moorpark near I-280/Winchester.
- » Complete fiber-optic communication backbone.

6.3-1.2 Neighborhood Traffic Management

The neighborhoods located on either sides of Winchester Boulevard are primarily residential, and provide access to and from other major roadways in the area, such as Moorpark Avenue, Payne Avenue, Williams Avenue, and Hamilton Avenue. As travel times along Winchester Boulevard increase, especially during peak hours, drivers may use alternate routes through surrounding residential neighborhoods to access other major roadways in the area in an effort to improve their overall travel time. Additional vehicles traveling through these neighborhoods could cause additional issues related to congestion, safety, speeding and noise within the surrounding residential areas.

Neighborhood traffic calming design features, such as medians and bulbouts, chicanes, speed tables, curb extensions, traffic circles, raised or enhanced crosswalks and flashing beacons, and additional signage, are effective in calming vehicular travel speeds and improving safety for all people. Bicycle Boulevards, are roadways that prioritize bicycle travel over vehicular travel (see section 6.3-2), are an effective strategy for improving safety. These methods all may help reduce cut-through traffic by increasing cut-through routes travel times.

Policies

Policy 6-8: Utilize traffic calming and re-routing design features to reduce vehicle speeds and increase travel-times in order to discourage neighborhood cut-through traffic and create a safer and more comfortable residential neighborhood environment.

Action Items

- » Assess how new potential vehicular connections will impact travel patterns in neighborhoods.
- » Where appropriate, identify and implement traffic rerouting and calming treatments that lower automobile speeds, decrease travel times, and have been shown to noticeably reduce neighborhood cut-through traffic.

6.3-1.3 Transportation Demand Management and Parking Management

Transportation Demand Management (TDM) strategies that include parking management strategies will make the most efficient use of transportation networks and parking stocks, and help to address city-wide traffic issues. Transit and active transportation networks in the Village have unused capacity, while roadways are congested during peak times but under used at other times. Transportation Demand Management (TDM) strategies that include parking management can result in more efficient use of transportation networks and parking facilities. Incentives and pricing should induce some travelers to change their travel choices, resulting in more efficient use of the transportation system.

Developments in the Urban Village should create, implement, and maintain transportation demand management programs for their sites. These programs should incentivize tenants and visitors to use non-single occupant vehicle travel modes and travel during non-peak times. Programs should be tailored to each developments' setting and user contexts to most cost effectively motivate needed changes in travel choices.

The strategies listed below are not comprehensive; rather, they are an introduction to some of the more common transportation demand and parking management strategies. New TDM strategies are continually being implemented worldwide, and developers should research potential new strategies while developing their TDM plans.

GOAL CS-4 Develop and implement effective Transportation Demand Management (TDM) strategies that improve traffic flow by minimizing vehicular trips and vehicles miles travel (especially during peak times) and increasing use of alternatives modes like walking, biking, transit, and ridesharing.

GOAL CS-5 Effectively manage the supply, demand, and pricing for parking to ensure a sufficient amount of parking exists to meets the needs of residents, business and visitors.

Policies

Policy 6-9: All new development projects should use Transportation Demand Management (TDM) strategies designed to reduce automobile traffic, improve traffic flow, and increase use of alternatives modes like walking, biking, transit, and ridesharing.

Policy 6-10: New developments should provide subsidized transit passes to their employees and residents.

Policy 6-11: Encourage carsharing and/or bikesharing programs.

- Policy 6-12:** Support shuttles that circulate within the Urban Village area and potentially connect to regional destinations like Diridon Station in Downtown San José.
- Policy 6-13:** To help reduce employee parking demand, employers should encourage employees to use alternative modes by providing incentives, such as commuter choice tax provisions, guaranteed ride home programs, and vanpool startup costs.
- Policy 6-14:** All new developments in the Urban Village area shall be required to implement parking management strategies designed to manage parking demand.
- Policy 6-15:** A system of communication and differentiated parking strategies should be implemented as a method for encouraging drivers to use parking efficiently.
- Policy 6-16:** Parking cash-out programs should be required for all employers with designated free parking spaces for employees.
- Policy 6-17:** Support shared parking spaces, which is the use of a parking space to serve two or more individual land uses that have different hours of operation, and parking technologies.

Action Items

- » Support the formation of a Transportation Management Association (TMA).
- » Study the feasibility of City-operated public parking structures near freeway offramps.
- » Explore the feasibility of creating a Parking Benefits District.

6.3-1.4 Developing Transportation Technologies

Appropriately incorporating developing technologies into the Village area will improve safety, mobility, and environmental sustainability. The technologies this Plan intends to take advantage of include fiber optics, shared mobility services, autonomous vehicles, and Transportation Network Companies (TNCs) in ways that provide a net benefit.

SHARED MOBILITY SERVICES

Shared mobility services provided by Transportation Network Companies (TNCs) are increasingly used in the San Francisco Bay Area for a variety of trip purposes. In addition, transit stations are popular beginning or end

points for shared mobility trips, which suggests that these activities will be a well-used travel mode in between regional transportation services and the Winchester Urban Village. The proposed street network considers the need to accommodate all types of vehicle trips, including shared mobility trips.

Policies

- Policy 6-18:** Support strategies to promote convenient Transportation Network Company (TNC) passenger pick-up and drop-off in the Urban Village area, especially near activity centers.
- Policy 6-19:** Ensure that TNC vehicle drop-off/pick-up areas do not conflict with bicycle lanes.
- Policy 6-20:** Permit U-turn movements at intersections to facilitate

Transportation Network Company (TNC) passenger pick-up and drop-off areas can help connect travelers with regional transportation services easily and safely.

directional changes of TNCs.

Action Items

- » Identify proposed TNC drop-off and pick-up locations.

AUTONOMOUS VEHICLES

Autonomous vehicles, also termed automated, driverless, self-driving and robotic vehicles, are those which are capable of sensing their own environments in order to perform at least some aspects of the safety-critical control without direct human input. In the future, autonomous vehicles may become increasingly common on streets in the Urban Village.

To accommodate for future travel needs, the Urban Village Plan aims to provide a general framework for autonomous vehicles.

A complete bicycle network that links residential, businesses, recreation and transit stations encourages walking and bicycling.

Policies

Policy 6-21: Appropriately accommodate future forms of vehicle travel, such as autonomous vehicles, in ways that provide net benefit.

Action Items

- » Assess current readiness for, and potential impacts of, autonomous vehicles on the transportation network.

6.3-2 BICYCLE AND PEDESTRIAN NETWORK

Walking and biking can be convenient, enjoyable, and healthy alternatives to automobile travel, particularly for shorter trips. To encourage walking and bicycling, the street network must include connected bicycle networks that link residences, businesses, recreation and transit stations, and that remove barriers for people who walk and bike. The Winchester Urban Village bicycle and pedestrian network is diagrammed in Figure 6-6.

All users of streets, including automobile drivers and people who use transit, are pedestrians at some point in their journey, and origin points and final destinations are commonly accessed using sidewalks. Sidewalks help establish a continuous pedestrian network that minimizes barriers and interruptions along the path of travel; is intuitive and easy to navigate; and feels safe and comfortable to walk along.

Policies

Policy 6-22: Complete, expand, and enhance bicycle and pedestrian networks.

Policy 6-23: Shared bicycle lanes (Class III) shall be implemented in residential neighborhoods where appropriate.

Policy 6-24: Standard and enhanced bicycle lanes (Class II or Class IV) shall be implemented on major streets where appropriate.

Policy 6-25: Safety enhancements shall be implemented on existing bicycle routes in the Urban Village.

Policy 6-26: Complete the sidewalk network and maximize connectivity by removing barriers and interruptions along the path of travel.

Action Items

- » Improve bicycle and pedestrian routes across I-280 along Winchester Boulevard.

- » Ensure that the current VTA-led I-280/Winchester Boulevard planning process provides bicycle and pedestrian solutions that are in conformance with this Plan.

Bicycle Boulevards

A bicycle boulevard is a local street in which the two travel lanes are shared by bicycle and motorized vehicles, with priority given to cyclists. As a result, cut-through motor-vehicle traffic is discouraged and often diverted. Eden Avenue, which is in some areas within the Winchester Urban Village, in some areas west of the Village, and in some areas aligned with the western boundary of the Village, provides local access to residential neighborhoods in the areas between Moorpark Avenue and Hamilton Avenue. This Plan recommends the conversion of Eden Avenue into a bicycle boulevard, which would facilitate the achievement of many objectives detailed in this Plan—particularly issues related to cut-through traffic.

Policies

- Policy 6-27:** Bicycle boulevards shall be implemented in residential neighborhoods where appropriate.
- Policy 6-28:** Encourage bicycle boulevards along roadways as a strategy to help reduce neighborhood cut-through traffic.
- Policy 6-29:** Bicycle boulevards should connect with the existing bike network and provide cyclists with a comfortable alternative route to nearby destinations.

Action Items

- » Assess the feasibility of installing a bicycle boulevard along Eden Avenue and other appropriate streets.

GREEN CONNECTORS

“Green Connectors” are areas reserved for pedestrian and human-powered vehicles, such as bicycles, skateboards and kick scooters, in which most or all automobile traffic may be prohibited. These streets are designed to better accommodate accessibility and mobility, while also improving the attractiveness of the local environment in terms of aesthetics, air pollution, noise and collisions involving pedestrians. Green connectors provide shortcuts that encourage walking and biking by increasing visibility and accessibility between different portions of the Urban Village.

Policies

- Policy 6-30:** All properties that include a Green Connector shall be required to provide space, access, and improvements to the portion of Green Connector on the property during redevelopment.

Bicycle boulevards share both vehicular and bicycle traffic, but prioritize people who bike as through-going traffic.

Green connectors prohibit vehicular uses and provide shortcuts that encourage people who bike and walk.

Green connectors are encouraged to feature a double row of trees.

Policy 6-31: Green Connectors shall be a minimum of 20 feet wide with a minimum 12 foot clear walking/biking path clear to the sky in the Winchester Urban Village.

Policy 6-32: Encourage the installation of green connectors that enhance the pedestrian environment and improves connectivity throughout the Urban Village area.

Policy 6-33: Green Connectors shall be open to the public at all times.

For more information on bike and pedestrian facilities & amenities refer to Section 6.4-1.2.

6.3-3 TRANSIT NETWORK AND SERVICE

Transit for the Urban Village is serviced by Valley Transportation Authority (VTA). The City works closely with VTA to increase transit ridership through land use, density, roadway design, transit service, and other strategies. In addition, private “microtransit” services, like Chariot which now operates in the Willow Glen neighborhood and elsewhere in the Bay Area, have recently started becoming available.

The Winchester Urban Village currently lacks sufficient regional transit connectivity to the existing and planned high quality transit services in the surrounding area. Figure 6-7 shows the two existing VTA bus routes serving the Urban Village: Route 25, which runs along Williams Road west of Winchester Boulevard and Moorpark Avenue east of Winchester Boulevard; and Route 60, which runs along Winchester Boulevard. In addition, VTA has released a Next Network Plan with proposed transit lines, shown on Figure 6-4.

GOAL CS-6 Improve transit options to encourage use of transit.

Policies

Policy 6-34: Accommodate all forms of public and private transit services.

Policy 6-35: Public and private transit services should improve connectivity between the Urban Village area and surrounding regional transit services.

Policy 6-36: Increase the frequency and quality of public transit services operating in the Urban Village area.

Policy 6-37: Support partnerships with on-demand transit services to provide more travel options for people who use transit.

Action Items

- » Coordinate with VTA (Figure 6-4) to bring more frequent, direct, and higher quality transit to the Urban Village area.
- » Develop partnerships with on-demand transit services and assess the impacts of incorporating these services in the Urban Village area.

For more information on transit see Section 6.4-1.3.

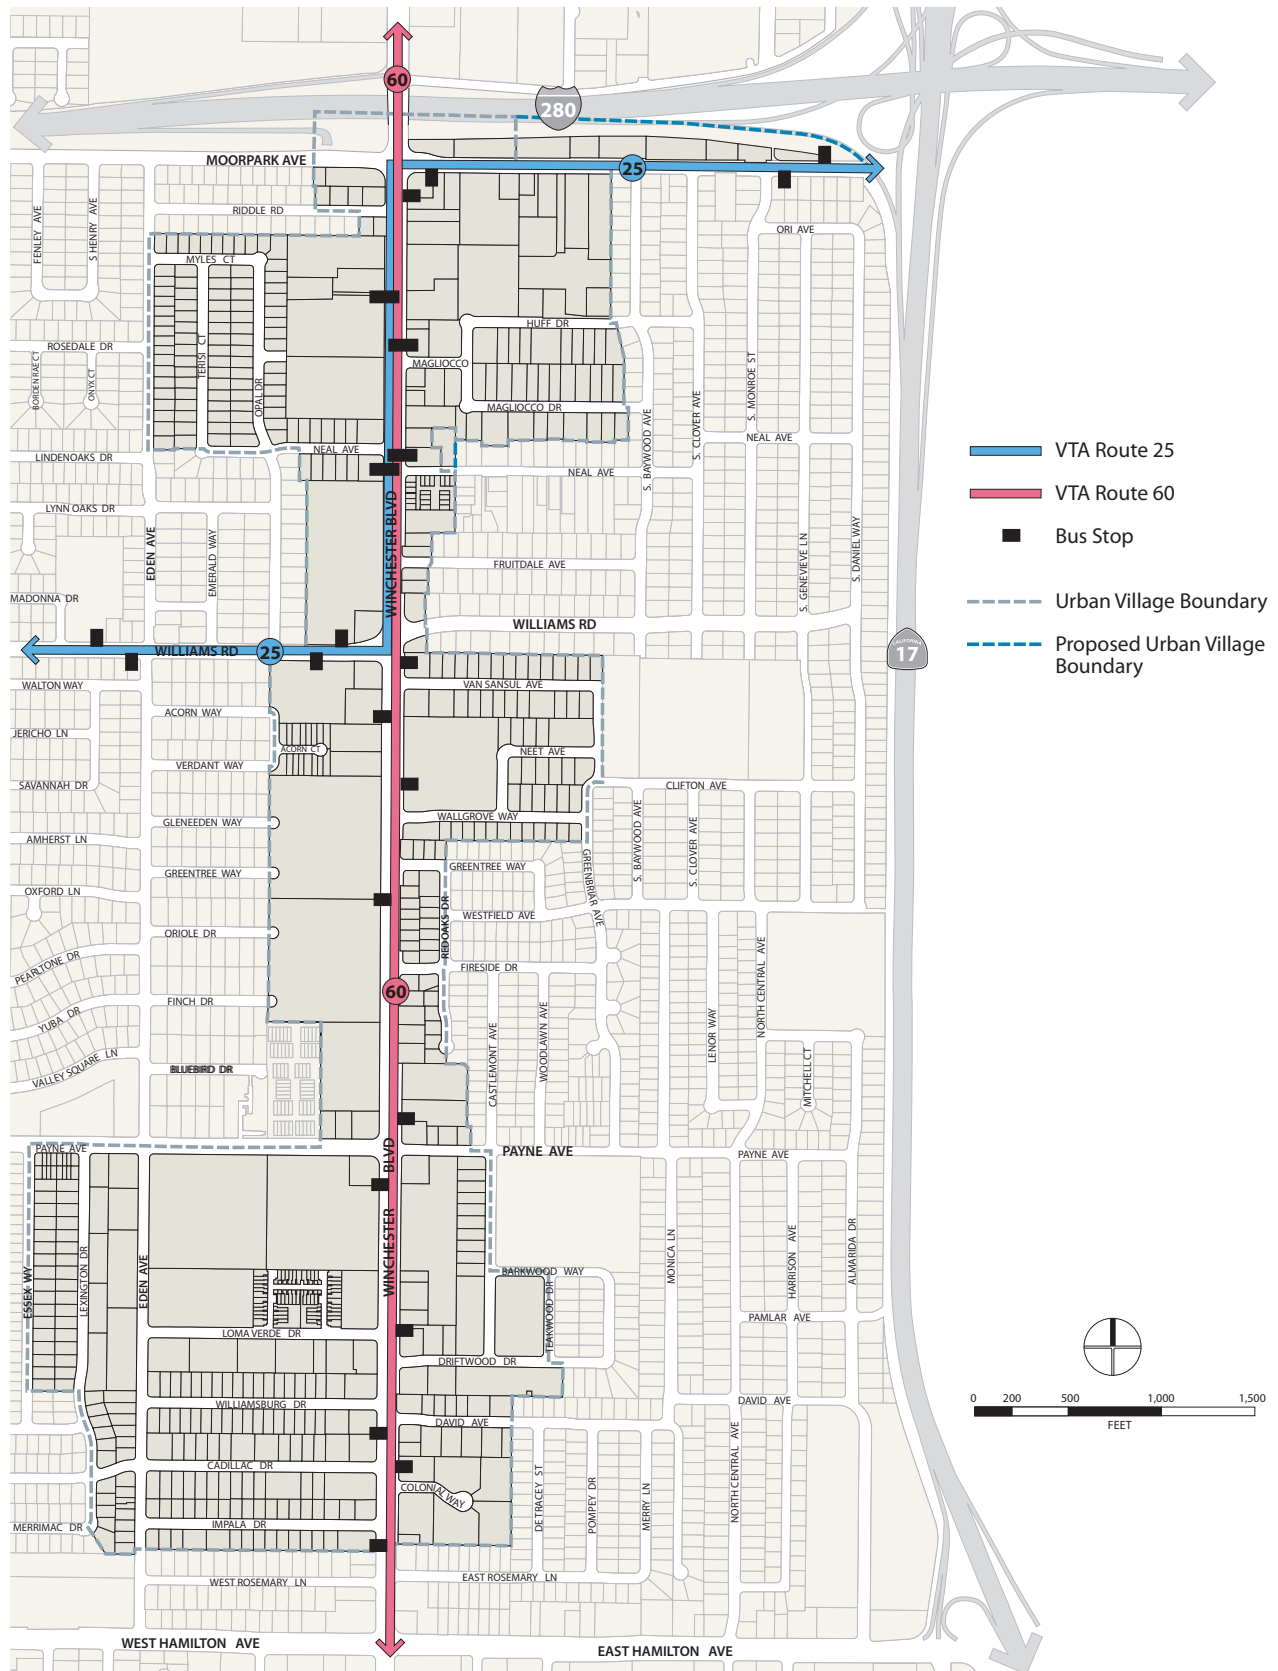

6.3-4 STREET TYPOLOGIES AND FUNCTION

To ensure a balanced, multimodal transportation network, the San José General Plan organizes street facilities according to “typologies.” Street typologies are an expansion of functional classifications that consider roadway’s adjacent land use, appropriate travel speeds, and the need to accommodate multiple travel modes. These street typologies also serve as the link between roadway circulation and streetscape design, as recommended streetscape improvements are, in some instances, based on typology. The street typologies within the Urban Villages are shown in Figure 6-8 and described in Table 6-1.

For more information on street typologies and function refer to the Urban Design Chapter.

TABLE 6-1: EXISTING GENERAL PLAN ROADWAY TYPOLOGIES			
ROADWAY TYPOLOGY	ALL MODES ACCOMMODATED?	PRIORITY MODE	DESCRIPTION
Grand Boulevards	Yes	Transit	<ul style="list-style-type: none"> High standards of design, cleanliness, landscaping, gateways, and wayfinding If there are conflicts, transit has priority
On-Street Primary Bicycle Facilities	Yes	Bicycles	<ul style="list-style-type: none"> If there are conflicts, bicycles have priority
(City & Local) Connector Streets	Yes	All modes accommodated equally	<ul style="list-style-type: none"> Pedestrians accommodated with sidewalks
Residential Streets	Yes	All modes accommodated equally	<ul style="list-style-type: none"> Pedestrians accommodated with sidewalks or paths Through traffic discouraged

FIGURE 6-7: WINCHESTER BOULEVARD BUS ROUTES

6.4 Streetscape

The proposed streetscape plan incorporates a comprehensive approach to the practice of mobility planning by coupling the concepts and objectives of “complete streets” with the street typologies and functions defined in the *Envision San José 2040 General Plan* and the *San José Complete Streets Design Guidelines*.

Complete streets are roadways designed to safely accommodate many different users, including people who bike, people who walk, transit riders, motorists, and emergency vehicles. They’re also designed to accommodate people with a diverse set of needs, such as the needs of children, people with disabilities and seniors. Complete streets help make a more walkable, healthy, and sustainable community by encouraging people to walk and bike and creating an environment where all people feel safe and welcome on the roadways. In addition, elements of complete streets are often selected based on adjacent land uses, with the aim of providing amenities that will best serve the users of these important public spaces. The proposed streetscape plan defines street typologies and function, and details streetscapes of major corridors. Additionally, this section discusses green infrastructure, placemaking and activation of public spaces.

GOAL CS-7 Strengthen the quality-of-place and improve economic vitality and quality of the Urban Village with supportive streetscape improvements.

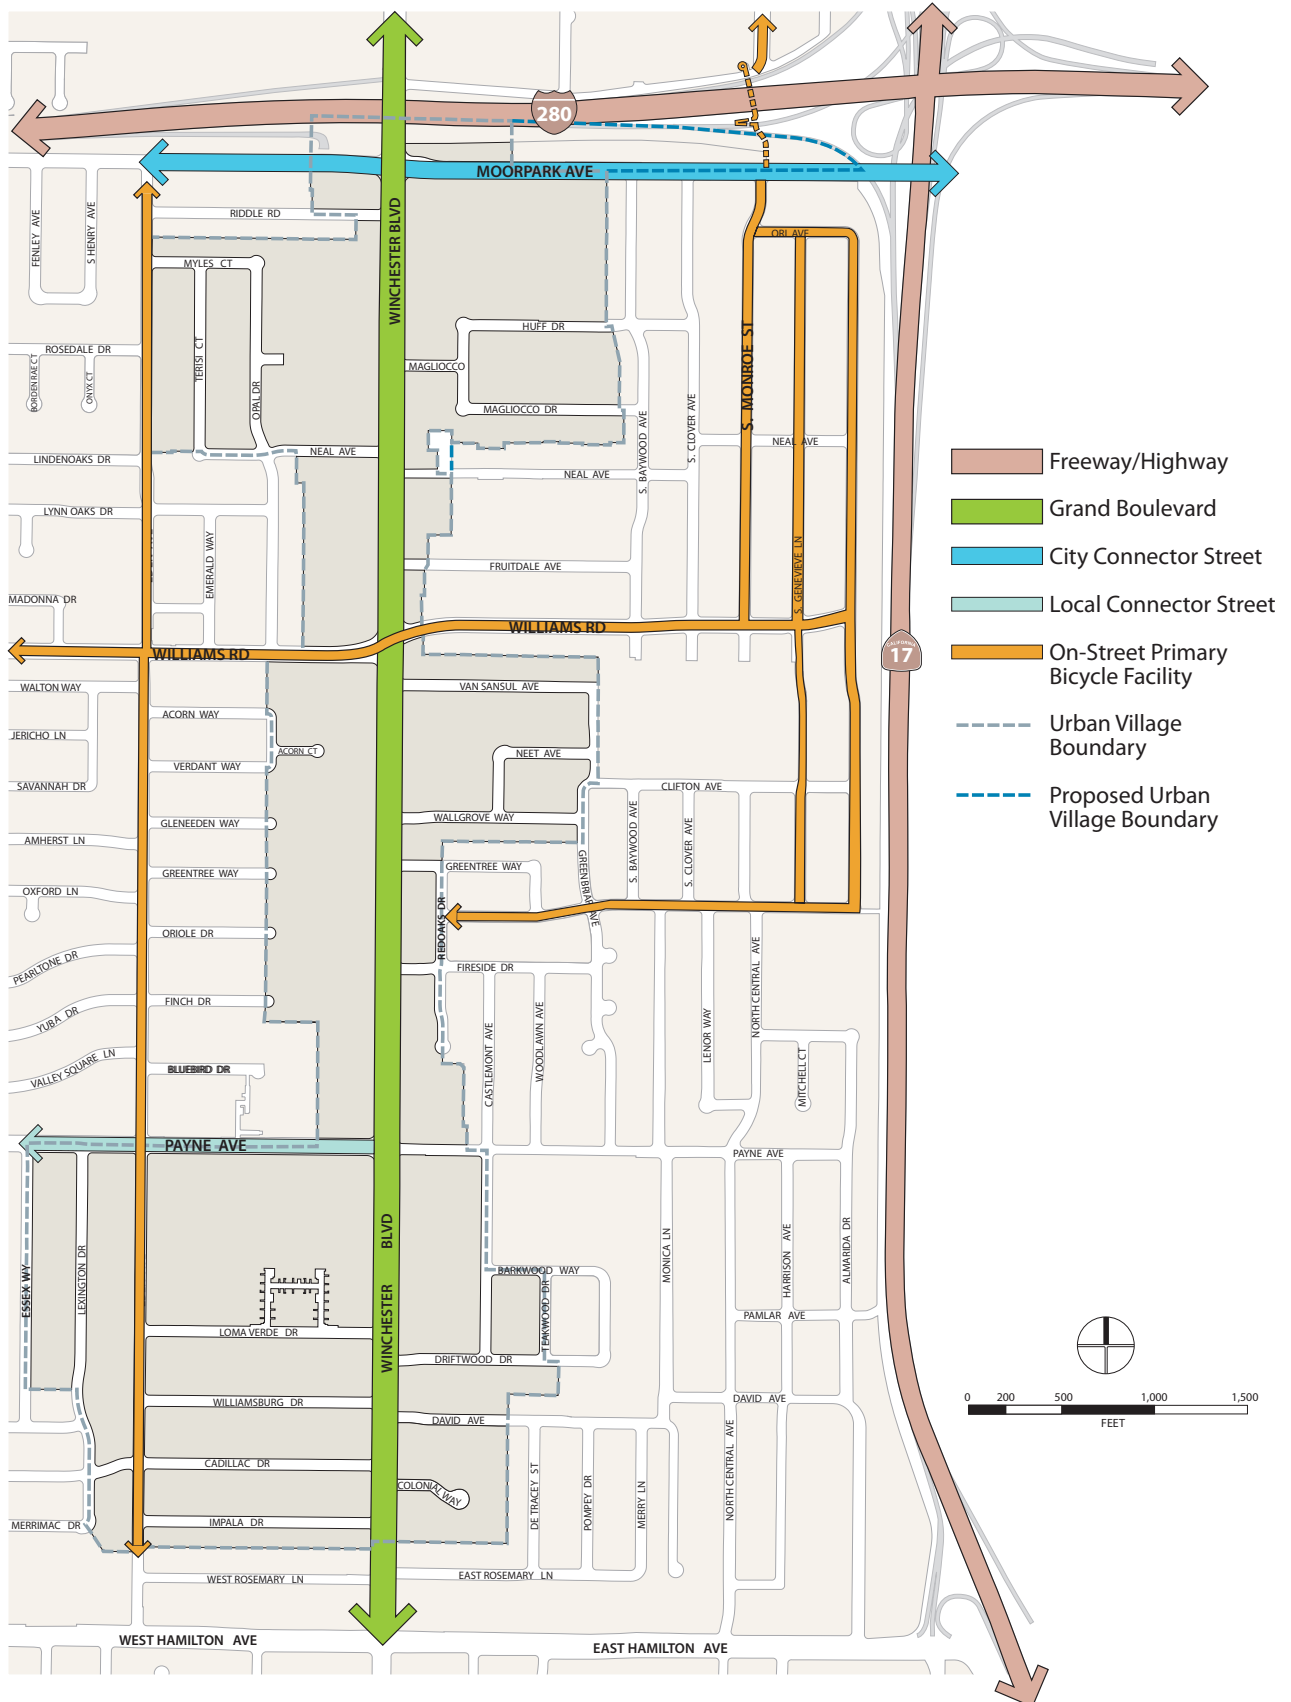

Policies

- Policy 6-38:** Improve streetscapes to effectively improve multi-modal safety, reduce cut-through traffic, improve traffic flow, and create more walkable, bikeable and transit friendly environments.
- Policy 6-39:** Reduce the number of driveways along Winchester Boulevard to enhance safety for people who walk and people who bike and improve streetscape character.

Streetscape strategies are shaped by the network of transportation options and adjacent and nearby land uses.

FIGURE 6-8: WINCHESTER BOULEVARD STREET TYPOLOGIES

The Winchester Urban Village Plan envisions a transportation network that successfully integrates automobiles, people who use transit, bike and walk.

6.4-1 ELEMENTS OF COMPLETE STREETS

Complete streets are integral parts of the Urban Village and part of a transportation network that successfully accommodate people who bike, walkers, people who use transit, and vehicle drivers. Complete street improvements are recommended throughout the Urban Village. In the areas designated as Ground Floor Commercial Required overlay, a more amenity-oriented approach, with special landscape, lighting, bicycle parking, and/or paving materials, will be provided to complement the higher levels of activity.

GOAL CS-8 Support recommended streetscape improvements with appropriate treatments from the San José Complete Streets Design Guidelines.

Policies

Policy 6-40: Ensure all streets in the Urban Village area are designed as complete, well-integrated streets according to the modal priorities defined in the Envision 2040 General Plan and San José Complete Streets Design Guidelines.

For more information on elements of complete streets refer to the Urban Design Chapter.

6.4-1.1 Accessibility, Usability, and Safety

To increase the usability of streets for all people, including people with disabilities, seniors, and parents with strollers or young children, routes in the Winchester Urban Village should provide clear and accessible paths of travel free of barriers and obstructions.

Policies

Policy 6-41: At a minimum, follow the Americans with Disabilities Act (ADA) guidelines for accessibility of elements such as, but not limited to, sidewalks and curb ramps.

A priority of the Winchester Urban Village Plan is to enhance sidewalk design features such as planting strips.

Action Items

- » Upgrade all facilities to meet ADA standards.

6.4-1.2 Bike and Pedestrian Facilities and Amenities

Complete streets are designed to meet the needs of both people who walk and people who bike. This section provides a discussion of strategies to implement bicycle and pedestrian facility improvements. Potential strategies include improving bicyclist and pedestrian environment and connections by incorporating public space and waiting areas, installing additional bicycle facilities, and reducing barriers to walking and bicycling.

SIDEWALKS

Sidewalks along Winchester Boulevard should be a minimum of 20 feet wide. Where the existing sidewalk in front of a development project is less than the required minimum, the project must make up the difference such that the entire 20 feet is publicly accessible and functions as a sidewalk. A curbside planting strip and/or rain garden a minimum of 4 feet wide shall be considered for frontages along Winchester Boulevard that do not have curbside parking, and corner curb bulb-outs shall be provided wherever feasible and appropriate.

GOAL CS-9 Create an Urban Village that is safe, comfortable, and convenient place for people to walk.

GOAL CS-10 Enhance pedestrian environments and improve connectivity along and across Winchester Boulevard and to and from parks and plazas.

GOAL CS-11 Reduce barriers to walking.

Policies

Policy 6-42: Physical treatment should not obstruct a clear path of travel.

Policy 6-43: All future development projects shall meet the 20-foot minimum sidewalk width along Winchester Boulevard. Where the sidewalk in front of a development project falls short, the project must make up the difference so that the entire 20 feet is publicly accessible and functions as a sidewalk.

Policy 6-44: A curbside planting strip and/or rain garden a minimum of 4 feet wide shall be considered for frontages along Winchester Boulevard that do not have curbside parking.

Policy 6-45: Strengthen pedestrian connections and incorporate public space and waiting areas within new development.

Policy 6-46: Encourage pedestrian-oriented features that enhance the pedestrian environment.

Policy 6-47: New projects should accommodate pedestrian oriented activities and elements such as street furniture, planting, awnings, café and restaurant seating, and outdoor retail displays.

Policy 6-48: Install corner bulb-out where feasible and appropriate.

Action Items

- » Complete, expand, and enhance the sidewalk network.
- » Upgrade all sidewalks to meet ADA standards.
- » Identify pedestrian-oriented design elements that can be applied throughout the Urban Village.

BICYCLE FACILITIES

Bikeways

Bicycle lanes (Class II & IV) are usually provided to allow cyclists to ride at their preferred speed and without interference from prevailing traffic conditions. Colored bicycle facilities, or colored pavement treatments within the lane increases the visibility of the facility, identifies a potential conflict area to travelers, and clarifies priority to people who bike. Bicycle lanes (Class II) are lanes adjacent to the outer vehicle travel lanes that provide a designated space for people who bike through the use of pavement markings and signage. Where bicycle lanes feature buffers or are separated from the roadway, they are known as cycle tracks (Class IV). Shared lane markings (Class III) are used to indicate a shared lane environment for people who bike and automobiles.

Dutch-Style Intersections

Proper Dutch-style intersection designs strive to slow turning vehicles, provide good sight lines, and shorten pedestrian crossings. Dutch-style intersection design elements can increase bicyclist safety and comfort and help manage vehicular traffic speeds. These intersections are particularly useful on streets with protected bike lanes. Specific elements include high quality bicycle waiting areas at corners, colored pavement delineators to guide bicycle travel paths, and narrowed intersections with smaller curb radii to reduce vehicle turning speeds.

GOAL CS-12 Create a complete network of low-stress bikeways throughout the Urban Village.

Alternative Transportation

Bicycle Facilities strategies are shaped by the network of transportation options and travel behavior changes.

A Dutch-style intersection delineates uses and creates safer crossings for people who walk and people who bike.

Class IV cycle tracks are separated from vehicular and pedestrian uses and are proposed on major streets in the Urban Village area where appropriate.

The Winchester Urban Village Plan aims to strengthen bicycle and pedestrian conditions and connections throughout the Urban Village area.

Providing safe and convenient bicycle storage/parking will encourage bicycle use.

Policies

Policy 6-49: Colored bicycle facilities shall be utilized at conflict areas.

Policy 6-50: Provide safe and comfortable connections to the existing bicycle facilities along Winchester Boulevard, Williams Avenue and Payne Avenue.

Policy 6-51: Dutch-style intersections shall be considered in the bicycle network where appropriate as opportunities arise.

Action Items

- » Implement protected bike lanes (Class IV) with colored pavement treatments in conflict zones on both sides of Winchester Boulevard.

Bicycle Parking/Storage

Safe and convenient places for cyclists to park or store their bicycles along or at the end of a trip are important elements of complete streets. Many bicycle owners may be encouraged to make bicycle trips if there is sufficient bicycle parking and storage.

GOAL CS-13 Ensure bicycle parking is included at common destinations, such as at local businesses, schools, transit areas, and other popular destinations.

Policies

Policy 6-52: New developments shall provide well-located, visible bicycle parking and/or storage facilities along sidewalks, in parking garages, and building entrances and public sites as defined in San Jose Municipal Code Title 20.

Policy 6-53: Bicycle parking should include both bicycle racks and lock-up devices where people spend short periods of time (e.g. retail stores).

For more information on bicycle parking and storage refer to the Urban Design Chapter.

CROSSINGS

Crossings used to enhance the pedestrian experience should be constructed to be universally accessible and designed for use of people of all abilities. Crossings should provide designated connections to and from major pedestrian generators, such as ground floor retail, public space, and/or bus stops, and along well traveled pedestrian routes. To accommodate people of all ages and abilities, crossings should be designed to increase visibility between drivers and other people, and minimize crossing times and distances. Overall, crossings should be designed as part of the entire roadway network to provide flexibility when considering traffic flow, signal timing, and signal operation.

Midblock crossings, which are located outside of intersections, are determined largely by pedestrian desire lines. These occur on long blocks, in locations where activity-generators are located across the street from one another, or where other midblock crossing activity is occurring.

Policies

Policy 6-55: Consider new crossings to improve pedestrian connectivity to parks, neighborhood services and transit amenities, and improve safety for all people.

Policy 6-56: Safety standards that are consistent with the City of San José regulations shall be incorporated in all crossings.

Action Items

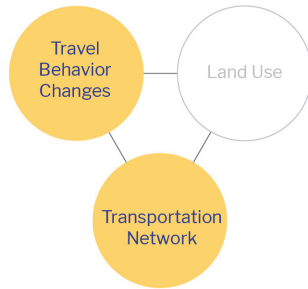

- » Assess the feasibility and appropriateness of implementing proposed new or enhanced intersections/crossings. Potential locations for enhanced crossings and new mid-block crossings are indicated in Figure 6-6.

The Winchester Urban Village Plan aims to improve crossings and connections to parks, neighborhood services and transit amenities.

Alternative Transportation

Transit stops, facilities, and access route strategies are shaped by the network of transportation options and travel behavior changes.

6.4-1.3 Transit Stops, Facilities, and Access Routes

Transit stops should be attractive pedestrian-oriented landmarks. They should include benches, shelters, lighting, and other amenities.

Policies

Policy 6-57: Transit friendly complete street elements shall include improved transit stops.

Policy 6-58: Enhance overall transit rider and pedestrian experience at transit stops.

Policy 6-59: Support transit-friendly design elements.

Policy 6-60: Enhance transit stops with distinct signage, lighting, landscaping, and well-designed bus shelters.

Policy 6-61: Improve access to transit.

Action Items

- » Coordinate with VTA to locate, design, and improve transit facilities
- » Improve the transit waiting environment by upgrading bus stop amenities.

For more information on transit stops, facilities and access routes refer to the Urban Design Chapter.

Mid-block crossings can provide direct routes and can enhance safety for people who walk.

Transit stops should have pedestrian-oriented features and amenities.

6.4-1.4 Street Trees & Landscaping

Street trees and landscaping are essential elements of a comfortable, accessible, and inviting streetscape, indicating publicly-accessible space while also serving as a source of shade and green. The Plan requires that street trees be provided along all publicly accessible streets and major pedestrian ways, with consistent species used along the length of a street or pedestrian path. Tree grates should be provided in the areas designated as Ground Floor Commercial Required and any other locations where street trees are adjacent to curbside parking; where trees are not adjacent to curbside parking, planting strips should be considered. This section identifies the requirements for street trees throughout the Urban Village, including species, frequency, location, and size.

The trees described in Table 6-3 are recommended for the Winchester Urban Village. In general, deciduous and broadleaf evergreen trees are ideal for street and parking lot shade and are recommended for their habitat value and attractive foliage. Where canopy shade is not necessary, medium-size and flowering trees are recommended. Tree selection(s) should be made by the City Arborist for upright growth characteristics, growth speed to maturity, drought tolerance, shade provided, and availability. Final planting palettes may vary according to availability and site design.

GOAL CS-14 Create a comfortable, accessible, and inviting streetscape throughout the Village.

Street Trees

- Policy 6-62:** ADA-compliant decorative tree grates required, unless frontage conditions allow for larger landscape planters, rain gardens, or other amenities that can be coordinated with street tree planting.
- Policy 6-63:** Significant existing frontage trees should be retained and incorporated into front setback areas.
- Policy 6-64:** Existing London Plane street trees should remain, with additional infill trees planted to create a continuous canopy as required by the Plan.
- Policy 6-65:** A double row of trees framing the sidewalk shall be considered where space allows.
- Policy 6-66:** For visibility and maintenance, medians, rain gardens, and frontage planting areas shall contain high-branching canopy trees and low-growing shrubs or groundcovers. Existing conifer trees and tall shrubs shall be replaced to improve visibility and perception of the street as a unified public space. Plantings in rain gardens should follow the approved planting list in the C.3 handbook.

Alternative Transportation

Policy 6-67: In Ground Floor Commercial Required areas, trees should be planted in curbside tree wells with a minimum horizontal dimension of 4 feet (6 feet preferred) and planting soil depth of three feet. Where possible, larger subsurface areas should be created to encourage root growth. Approaches include trenches, structural soil, and suspended pavement systems. Approximately 1,000 cubic feet of soil volume is recommended to support a large canopy tree.

Policy 6-68: All trees shall be located away from parked-car door-swing areas and should be arranged in a formal manner with a regular spacing.

Landscaping

Policy 6-69: Plant materials should be drought tolerant and should be placed to reflect both ornamental and functional characteristics. Ornamental planting within setbacks and courtyard areas shall be selected for drought tolerance, hardiness, beauty and ability to support regional habitat, including pollinators and bird species.

Policy 6-70: Deciduous trees shall be the predominant large plant material used adjacent to buildings and within parking areas to provide shade in summer and allow sun in winter. Species should have deep roots, provide fall color, and minimize litter and other maintenance problems.

Policy 6-71: Evergreen shrubs and trees should be used as a screening device along rear property lines (not directly adjacent to residences), around mechanical appurtenances, and to obscure grillwork and fencing associated with service areas and parking garages.

Policy 6-72: Flowering shrubs and trees shall be used where they can be most appreciated, adjacent to walks and open space areas, or as a frame for building entrances, stairs, and walks.

Policy 6-73: Specimen trees, which are trees that have special characteristics yet require high levels of maintenance, may be considered for limited locations at key highly visible locations.

Policy 6-74: Flowers with annual or seasonal color are recommended to highlight special locations, such as courtyards, building entrances, or access drives.

- Policy 6-75:** Drip irrigation systems, including subterranean drip systems, should be provided for all planted areas, provided they are consistent with implementation requirements for use of recycled water.
- Policy 6-76:** Landscaping in surface parking lots should be designed as an integral feature of the site development plan. Landscape and shading approaches may include trellises, columns, walls, and/or arbors with vines, wind rows, or other elements.
- Policy 6-77:** Trees should be distributed evenly throughout parking lots to provide shade and enhance appearance, particularly as seen from adjacent streets and buildings.
- Policy 6-78:** Hedges and other freestanding mass shrub plantings should be kept relatively low – i.e., 36” or less – to maintain visibility. Taller screen plantings should be employed for large blank walls, mechanical equipment enclosures, and similar conditions.
- Policy 6-79:** Mounding Earth (or berming) should be avoided. Terracing should be used as an alternative to or in combination with sloped earth areas.

Action Items

- » Along Winchester Boulevard, install deciduous canopy trees, 50 feet on center +/- maximum, twenty-five feet on center, minimum 36” box size at time of planting, with 6 ft x 6 ft and/or 36 square feet.
- » Along City Connector and Local Connector Streets, install deciduous shade trees, 40 feet on center +/- . Minimum tree well 4’ x 4’ and/or 16 square feet. Minimum 24” box size at time of planting.
- » Retain existing London Plane trees.
- » Develop a landscape plan for Winchester Boulevard within the Winchester Urban Village.

TABLE 6-2: RECOMMENDED TREES		
TREE TYPE	PHOTO	DESCRIPTION
<i>Deciduous Canopy Trees</i>		
London Plane Tree <i>Platanus acerfolia</i> 'Columbia'		Deciduous, fast growth to 60' tall, needs low to moderate watering, large lobed leaves, good natural structure
California Sycamore <i>Platanus racemosa</i>		Deciduous, 30 to 80' tall and 20 to 50' wide, fast growth rate, often have multiple trunks, attractive patchy bark in brown, gray, and white.
Kentucky Coffee Tree <i>Gymnocladus dioicus</i>		Deciduous, height 50'-70' to 40'-50' wide, upward arching branches, medium growth, medium water, yellow leaves in fall, bark attractive with scaly ridges curling outward
American Elm <i>Ulmus Americana</i> (DED resistant varieties)		Height 60'-80', can grow over 100', width 40'-80', vase-shaped, medium to fast growth, medium water, lustrous green to dark green leaves, often yellow in fall, bark dark gray, fissured, with broad, deep, intersecting ridges

TABLE 6-2: RECOMMENDED TREES		
TREE TYPE	PHOTO	DESCRIPTION
Chinese Evergreen Elm <i>Ulmus parvifolia</i>		Evergreen in Santa Clara Valley, fast growth, 40 to 60' tall, with equal spread, moderate water, crown generally spreading with pendulant form, simple leaves, surface roots can be aggressive.
Hackberry <i>Celtis occidentalis</i>		Height 40'-60', width to 40'+, pyramidal when young, open branching elm-like, growth medium to fast, yellow leaves in fall, bark gray with rough and corky ridges
Sawleaf Zelkova <i>Zelkova serrata</i>		Deciduous, moderate to fast growth to 70' tall, upright vase shaped form, smooth bark, green leaves with yellow to dark red fall color.
<i>Deciduous Trees</i>		
Red Maple <i>Acer rubrum</i> (red fall foliage cultivars)		Deciduous, fast growth to 40' tall, needs ample water, red twigs, and buds, showy flowers, leaves are shiny green above, pale beneath, bright red fall color.
Ginkgo <i>Ginkgo biloba</i> (male only)		Deciduous, slow growth to 60' tall, needs moderate watering, unusual simple leaf, gold fall color, smog tolerant.

TABLE 6-2: RECOMMENDED TREES		
TREE TYPE	PHOTO	DESCRIPTION
Tupelo <i>Nyssa sylvatica</i>		Deciduous, moderate growth rate 30 to 50' tall, moderate water, wonderful red fall color, average roots, pyramidal shape when young grows more rugged in shape with age.
<i>Broadleaf Evergreen Trees</i>		
Brisbane Box <i>Lophostemon confertus</i>		Height 30'-50', width 20'-40', leaves thick, dark green and glossy above, paler beneath, flowers are white occurring in 3's, bark is smooth, sometimes lustrous, beige
Coast Live Oak <i>Quercus agrifolia</i>		Evergreen, slow growth 60' tall, small simple leaves, broad-dense canopy, drought tolerant- not recommended for irrigated areas. CA native.
Shumard Red Oak <i>Quercus shumardii</i>		Deciduous, moderately fast growth, 70' tall, fall color is yellow to red, wide spreading.
Cork Oak <i>Quercus suber</i>		Evergreen, moderate growth to 60' tall, low to moderate water needs, deeply furrowed corky bark, rounded canopy, needs good drainage.

TABLE 6-2: RECOMMENDED TREES		
TREE TYPE	PHOTO	DESCRIPTION
<i>Medium-Size and Flowering Trees</i>		
Chinese Pistache <i>Pistacia chinensis</i>		Deciduous, moderate growth to 25'-35' height, 25-35' width, drought tolerant, rounded or umbrella shape, full sun to partial shade, moist to dry soil, brilliant red-orange fall color.
Flowering Pear <i>Pyrus calleryana</i>		Deciduous, moderate growth to 30'-40' height, 20' width, moderate water, erect or spreading with a high canopy, oval shape, flowers showy white in spring or winter, full sun, moist to dry soil, fair resistance to fire blight and other conditions.
Crape Myrtle <i>Lagerstroemia indica</i> (Powdery Mildew resistant varieties)		Deciduous, moderate growth to 25' height, 25' width, drought tolerant, oval to rounded or vase shape with low canopy, flowers showy lavender, pink, red, rose or white in summer, full sun, moist to dry soil.
Western Redbud <i>Cercis occidentalis</i>		Deciduous, moderate growth to 10'-20' height, 10'-20' width, drought tolerant, erect or spreading with low canopy, flowers showy purple pink in spring, full sun to partial shade, moist to dry soil.

Rain gardens can mitigate stormwater runoff and filter out pollutants.

6.4-1.5 Green Infrastructure

Green infrastructure refers to the use of green storm-water management systems to capture and manage rain directly from the street, allowing runoff to soak into soil, filtering out pollutants like oil, and reduce the amount of storm-water that must be handled by stormwater infrastructure.

Permeable pavers are one type of green infrastructure that can add attractive variety to typical paving and should be used in many areas of the SRVF Urban Village streetscape. Some permeable systems allow storm water to flow between pavers; others provide a solid surface without gaps. Permeable paving can be used to help address storm water issues and contribute to streetscape aesthetics with unique textures and materials.

Policies

Policy 6-80: Where feasible and appropriate, curbs should be extended to accommodate different types of green infrastructure elements such as rain gardens, vegetated swales, infiltration and flow-through planters and storm-water tree wells.

Policy 6-81: Rain gardens should be installed adjacent to protected bike lanes to take advantage of grades/drainage patterns within right-of-way.

6.4-1.6 Lighting

Basic street lighting is important for safety. Attractive street lighting is important to encourage enjoyment of public places. Along Winchester Boulevard today, highway-type street lighting is the only type of lighting. It is focused on the roadway rather than sidewalk areas, and does not encourage pedestrian circulation, support investment in frontage properties, or promote the desired streetscape character.

Pedestrian-oriented street lighting should be installed throughout the corridor, with supplemental highway-type lighting located at intersections if required. Ornamental double-head or “high-low” pedestrian- and roadway-oriented lighting are recommended, with pedestrian-oriented lights at approximately 100 feet on center.

Trees, lights and curbside parking spaces should be designed together to create an orderly appearance and minimize conflicts, and pedestrian-oriented lighting should be pleasant, providing good illumination and color rendition, but not overly bright. Similarly, street light poles and fixtures shall be attractive in design and coordinated with the design amenities and furnishings, such as bus shelters, benches, and kiosks.

Policies

- Policy 6-82:** The City shall install pedestrian-oriented street lighting as part of implementation of the Winchester Boulevard Concept.
- Policy 6-83:** New development in Ground Floor Commercial Required should be required to provide pedestrian-oriented lighting along the street frontage.
- Policy 6-84:** Streets other than Stevens Creek Boulevard and Winchester Boulevard shall have standard City lighting, model/type per City requirements.
- Policy 6-85:** Pedestrian-oriented streetlights should be centered between trees to minimize light blocking, with heads mounted to provide illumination beneath the street tree canopy.
- Policy 6-86:** Luminaire heads shall contain “cutoff” fixtures with shielding to support “dark sky” objectives and minimize impacts on adjacent buildings.

6.4-1.7 On-Street Parking

Curbside parking is redundant with adjacent on-site parking lots and is therefore underused along much of Winchester Boulevard. It should be reduced in favor of complete street features such as bike lanes and/or landscape and lighting improvements.

Metered parking should be installed in residential areas adjacent to commercial areas to discourage spillover and long-term parking by employees of the commercial areas. Metered parking should be installed in commercial areas to encourage turnover of parking spaces and help manage on-street parking supply, while also providing short-term parking for visitors to the commercial area.

Policies

- Policy 6-87:** Curbside parking areas should be designed with paved step-out and crossing areas to accommodate frontage parking.
- Policy 6-88:** Install metered parking in commercial areas and in residential neighborhoods adjacent to commercial areas.

Alternative Transportation

Wayfinding signs improve the ability to navigate an area while they also enhance the identity of a community.

6.4-1.8 Wayfinding, Gateways, and Neighborhood Identity Elements

Wayfinding signs are intended to convey directional information while also enhancing the identity of a community. Clear navigation conveys directions to a wide range of destinations, including the location of transit stops, landmarks and places of interest, and historic information. Architectural and natural features may be used in wayfinding maps to improve the ability to navigate an area and the overall pedestrian environment.

Special gateway landscaping, signs, and structures are recommended at high visibility locations near Urban Village entrances and exits. Any special paving should be on private sites and maintained by the property owner. Gateway locations recommended by this Plan are:

- 1. The Winchester Boulevard/I-280 bridge
- 2. The intersection of Winchester Boulevard and W Rosemary Lane
- 3. Freeway and highway over and undercrossings

Policies

Policy 6-89: Wayfinding signs should be sized, designed and placed appropriately for all modes of travel.

Policy 6-90: Support wayfinding strategies that reinforce and enhance the identity of the neighborhood at points of transition and at other key nodes.

Policy 6-91: As appropriate, signage should include intuitive, widely understood symbology, and accommodations should be made for wheelchair users and the visually-impaired.

Policy 6-92: Wayfinding signs should have a cohesive design and feel, and incorporate a hierarchy of sizes for ease of interpretation.

Policy 6-93: At transit stops, wayfinding signs should communicate street layouts, popular destinations, and transportation networks.

Action Items

- » Develop and implement wayfinding design guidelines and strategies specifically for the Urban Village area.

6.4-1.9 Public Space Activation

Activation of public spaces is a goal of complete streets and an important part of improving the quality of the street environment. This section focuses on strategies in placemaking and public space activation along the street and at intersections. More details on placemaking is discussed in the Parks, Plazas and Place-making Chapter of this Plan.

Policies

Policy 6-94: Encourage improvements that support placemaking and public space activation.

Policy 6-95: Enrich the pedestrian experience with small gathering spaces and pedestrian oriented amenities, such as seating, improved lighting, landscape planters, shade and public art.

The Winchester Urban Village Plan aims to create gatherings spaces and pedestrian oriented amenities to enhance the pedestrian experience.

6.5 Winchester Boulevard as a Complete Street

Winchester Boulevard is one of the most-used and most-seen streets in San José today. It has a major effect on the local quality of life and on the character of local commercial and residential districts. Figures 6-9 and 6-11 illustrate existing typical sections along Winchester Boulevard (100 foot and 80 foot curb-to-curb width). The proposed roadway design for Winchester Boulevard is illustrated in Figure 6-10. An interim concept for Winchester Boulevard where the curb-to-curb width is the narrowest (80 feet) is shown in Figures 6-12 and 6-14.

San Jose General Plan identifies Winchester Boulevard as a Grand Boulevard and the community would also like to see Winchester Boulevard incorporate elements of a Main Street. Grand Boulevards serve as major transportation corridors and primary transit routes and Main Streets provide urban street space for social gathering and recreational activities. The proposed design for Winchester Boulevard combines many features defined in the Grand Boulevard and Main Street typologies, as well as other elements of complete streets. This Plan envisions Winchester Boulevard bridging these two typologies by continuing to accommodate high volumes of through traffic within and beyond the City, while also providing people who bike and people who walk with a safer and more comfortable environment.

The design was driven largely by the community's priorities, as identified in the two community workshops, the on-line community survey, and public advisory committee meetings. The community consistently identified its top priorities for Winchester Boulevard as protected bike lanes and auto travel lanes. The proposed Winchester Boulevard concept requires no modification to the existing curbs. The design retains the existing curb locations, at least four vehicular travel lanes, and two flex lanes for vehicle travel or parking while also incorporating a protected cycle track for the length of the corridor.

The proposed Winchester Boulevard concept emphasizes efficient traffic flow, high quality walking and bicycling environments, and incorporates other complete streets elements to create a balanced roadway for all modes of travel.

Policies

- Policy 6-96:** Winchester Boulevard shall be designed as a complete street.
- Policy 6-97:** Ensure that future streetscape designs of Winchester Boulevard prioritizes protected bicycle lanes and automobile travel in the Urban Village area.
- Policy 6-98:** Promote the design of Winchester Boulevard to combine features of Grand Boulevards and Main Streets typologies defined in the San José Complete Streets Design Guidelines.
- Policy 6-99:** Emphasize high quality walking and bicycling connections along, to, and from Winchester Boulevard.
- Policy 6-100:** Support improvements to the Winchester Boulevard/I-280 Bridge similar to those shown in Figure 6-16.
-

Action Items

- » Develop and implement a streetscape plan for Winchester Boulevard.

FIGURE 6-9: WINCHESTER BOULEVARD EXISTING - 100 FOOT RIGHT OF WAY

- | | | |
|--|---------------------------------------|-------------------------------------|
| ① Narrow sidewalk (8' ±) | ④ Existing street trees, long spacing | ⑦ Auto-oriented street lights |
| ② Building setbacks (10'-0' ±) | ⑤ Excess roadway | ⑧ Bus stop, no shelters |
| ③ Missing/long pedestrian crossings (100' ±) | ⑥ Surface parking frontages | ⑨ Extensive median with no planting |

FIGURE 6-10: WINCHESTER BOULEVARD CONCEPT - 100 FOOT RIGHT OF WAY - PROPOSED

- | | | |
|---|---|--|
| ① 6-lane through vehicular traffic | ④ Corner bulbout and median refuge to shorter crossing distance | ⑦ Protected cycle track |
| ② Sidewalks widened in setback area to 20' min. | ⑤ Pedestrian-oriented street lights | ⑧ Bus shelters |
| ③ Curb Radius (± 25') | ⑥ Rain garden buffer with intermittent walkway refuges | ⑨ Flexible lane may be used for parking, HOV lane, and/or transit/taxi lanes |

FIGURE 6-11: WINCHESTER BOULEVARD EXISTING- 80 FOOT RIGHT OF WAY

- ① Narrow sidewalk (8' ±)
- ② Residential frontage with planting strips, driveways, etc.
- ③ No pedestrian crossings (80' +)
- ④ Existing street trees, long spacing
- ⑤ Excess roadway
- ⑥ Surface parking frontages
- ⑦ Auto-oriented street lights

FIGURE 6-12: WINCHESTER BOULEVARD CONCEPT- 80 FOOT RIGHT OF WAY - PROPOSED (INTERIM)

- ① 3-lane through vehicular traffic (southbound)
- ② Signalized pedestrian crossing
- ③ Curb Radius (± 25')
- ④ Pedestrian-oriented street lights
- ⑤ Rain garden buffer with intermittent walkway refuges (southbound)
- ⑥ Protected cycle track (southbound)
- ⑦ Bike lane (northbound)
- ⑧ Flexible lane may be used for parking, HOV lane, and/or transit/taxi lanes (southbound)

FIGURE 6-13: WINCHESTER BOULEVARD CONCEPT - 100 FOOT RIGHT OF WAY - PROPOSED STREET SECTION

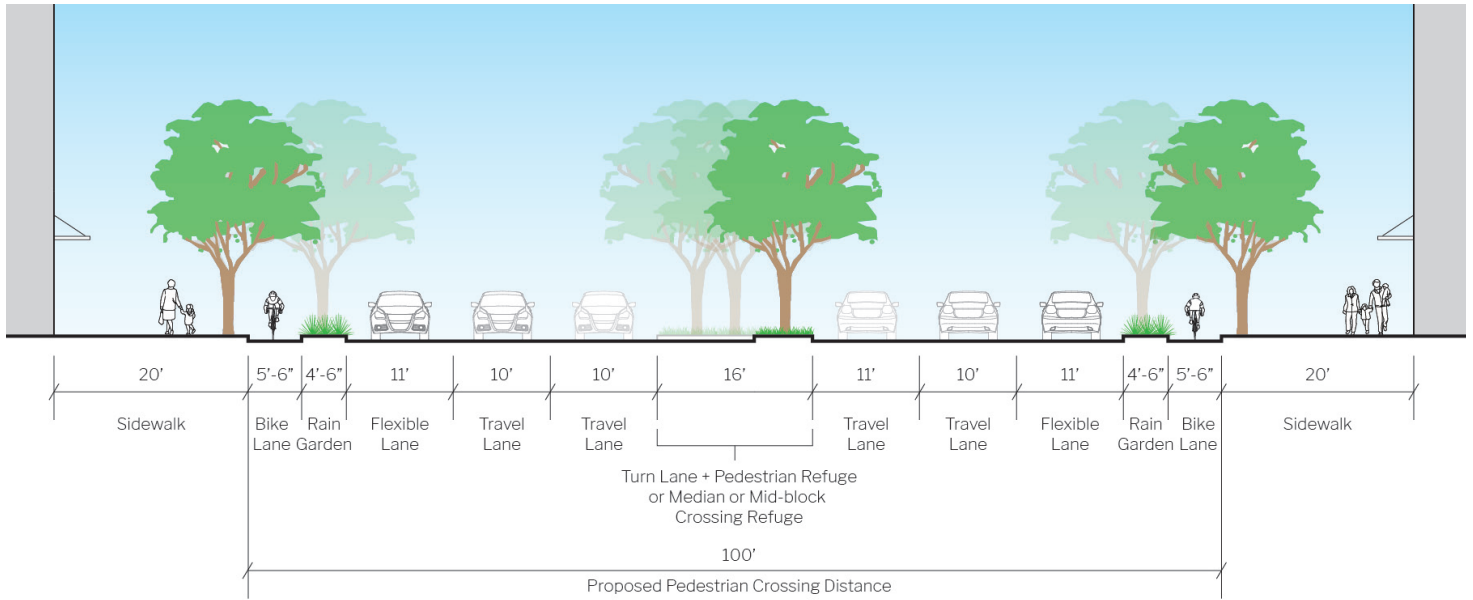

FIGURE 6-14: WINCHESTER BOULEVARD CONCEPT - 80 FOOT RIGHT OF WAY - PROPOSED STREET SECTION

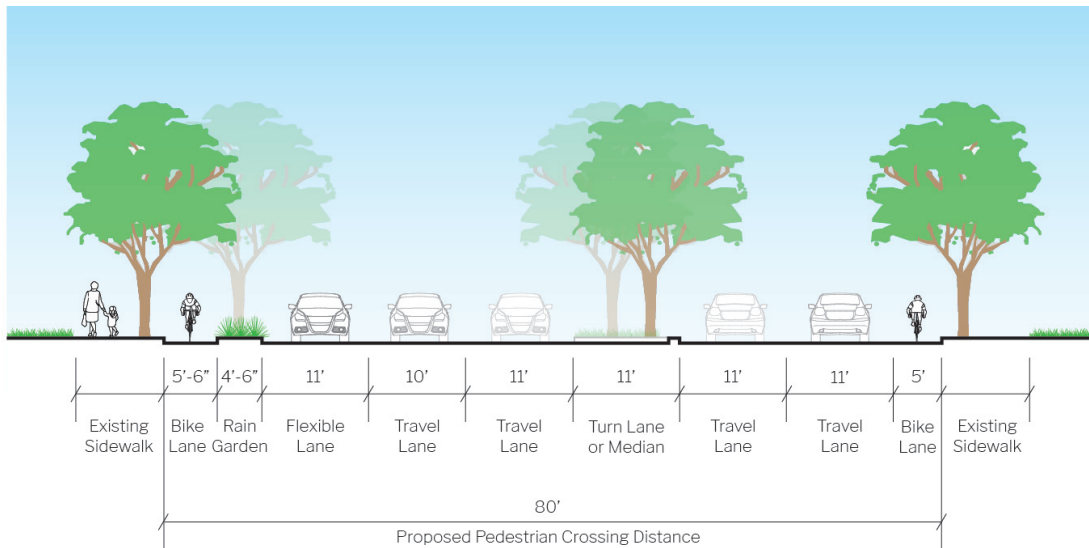

FIGURE 6-15: WINCHESTER BOULEVARD/I-280 BRIDGE - EXISTING

- | | | |
|--|---------------------------------------|-------------------------------|
| ① Narrow sidewalk (8' ±) | ④ Existing street trees, long spacing | ⑦ Auto-oriented street lights |
| ② Building setbacks (10'-0' ±) | ⑤ Excess roadway | ⑧ Slip lanes |
| ③ Missing/long pedestrian crossings (100' +) | ⑥ Surface parking frontages | ⑨ Wider curb radii (±60') |

FIGURE 6-16: WINCHESTER BOULEVARD/I-280 BRIDGE - POTENTIAL IMPROVEMENTS

- | | | |
|---|---|---|
| ① 4-lane through vehicular traffic | ④ Corner bulbout and median refuge to shorter crossing distance | ⑦ Bridge widened on both sides with decking for expanded mixed use path |
| ② Sidewalks widened in setback area to 18' min. | ⑤ Pedestrian-oriented street lights | ⑧ Median widened with existing left turn lanes |
| ③ Curb Radius (± 25') | ⑥ Rain garden | ⑨ On-street curb parking |

FIGURE 6-17: MODIFICATIONS TO WINCHESTER BOULEVARD

6.6 Next Transportation Planning and Implementation Steps

Several regional transportation planning efforts are being led by VTA that could affect future travel patterns and conditions within the Plan area. These include the VTA Next Network study, which is a multi-year effort aimed at improving the overall efficiency and performance of VTA's transit network. Proposed network changes were released in 2017 and could affect some bus routes within the Plan area, generally with more frequent and connected service. Additional regional studies are the VTA I-280 Corridor Study and the I-280/Winchester Boulevard Interchange Improvement study, both of which are looking at strategies to reduce traffic congestion on I-280 and local roadways and support multimodal travel options. The I-280/Winchester Boulevard Interchange Improvements study design alternatives are not anticipated to be completed until late 2017.

The County of Santa Clara's Expressway Plan 2040 Study is also underway and expected to be completed in Spring 2017. This plan takes a fresh look at the needs of the expressways based on city land use plans, projected 2040 traffic growth and Complete Streets planning. Expressway Plan 2040 will also identify new challenges and positive developments or opportunities, recommend any necessary policy changes, and revise funding requirements and implementation strategies.

Other future transportation planning efforts are envisioned in the Plan area subsequent to the Urban Villages plans, including a City of San José-led neighborhood traffic plan, multi-modal transportation improvement plan and traffic analysis. Additionally, the City envisioning completing an Area Development Policy and Environmental Impact Report for the Urban Villages areas in West San José.

This Plan is intended to inform adjacent and proximate planning efforts and projects.

Refer to the Implementation Chapter for more information.

6.6-1 MULTI-MODAL TRANSPORTATION IMPROVEMENT PLAN AND AREA DEVELOPMENT POLICY (ADP)

General strategies and key recommendations in this chapter are intentionally high-level and broad. Ultimately, these strategies will be incorporated into future, more detailed plans and accompanying implantation policies, such as a multi-modal implementation plan and area development policy (ADP) for West San José. The *Envision San José 2040* defines the City's desires "to provide a safe, efficient, and environmentally-sensitive transportation system that balances the needs of bicyclists, pedestrians, and public transit with those of automobiles and trucks." As a result, this Plan addressed all transportation modes in a manner that is representative of community values and provides guidance to achieve a balanced transportation network.

6.6-2 PHASING

While the ultimate goal of the Winchester Urban Village Plan is to fully and permanently implement the circulation and streetscape designs, policies, and actions described above, a number of actions may be taken in the interim to phase in the changes.

Aside from phased construction of roadway and streetscape design, the City may develop programs to temporarily implement changes in a way that demonstrates to the community their full impact without incurring the cost of full construction. "Tactical urbanism" approaches may include: outlining or drawing in chalk or paint such design changes as bikeways, green infrastructure, parklets, or Green Connectors, and incorporating movable fixtures such as potted plants, cones, or temporary signage, while at the same time encouraging community awareness and support through outreach programs and outdoor public events. The City may partner with local advocacy groups to employ these strategies for phased implementation.

Action Items

- » Pursue a Master Streetscape Plan.
